and Miscellaneous Particulars.
The uses of cork in Britain are well known. It was used as sandals by the Greeks, whence our cork soles, and probably the Venetian choppings (cioppini, Ital.), or shoes so high heeled, as to raise the women above the men. The poor people in Spain lay broad planks of it by their bed-side to tread on, as great persons use Turkey and Persian carpets to defend them from the floor; and sometimes they line the walls and insides of their houses built of stone with this bark, which renders them very warm, and corrects the moisture of the air. Both in Spain and Barbary bee-hives are made of cork; for this purpose, they roll the bark into a cylinder of five or six feet long, and six inches in diameter, boring holes for the entrance and exit of the bees, as in the Polish hive. (Encyc. of Gard. 1738.)
Q. coccifera, Cusoja, Span., has prickly leaves like those of the holly, or Q. ilex, from this speries is collected the kermes or scarlet grain, a little red gall, occasioned by the puncture of the Coccus ilicis. With these galls scarlet color was dyed, till the discovery of America, when another species of Coccus, the cochinillifer, was found in the Mexican woods upon the Cactus.
Q. phellos is remarkable for the form of the leaves, which differ in character from those of the rest of the species. Q. ilex, the holly, or holm oak, Chêne verd, Fr., Elice, Ital, and Enzina, Span., is a handsome evergreen tree, and the timber is supposed equal to that of the common oak. Q. gramuntia is thought by some

History, Use, Propagation, Culture,
to be only a variety of this species. The acorns of \(Q\). esculus are sweet, and, it is said, are frequently eaten by the poor in the south of France: the tree very much resembles the common English oak.

The willow oak grows to the height of about fifty or sixty feet. The \(Q\). virens, or live oak, grows to the height of forty or fifty feet, spreading its branches, when in open places, extremely wide; it yields the finest and most durable ship-timber of any species known; for which reason it is considered one of the most valuable trees in America. The laurel oak, or, as it is sometimes called, swamp willow oak, is about fifty or sixty feet high; its wood, according to the elder Michaux, is very valuable, and almost preferable to that of \(\mathbf{Q}\). virens, The water oak, \(Q\). aquatica, is about forty feet high when full grown: its wood is but little valued. Its leaves vary according to the soil and age, ad infinitum. There is scarcely one tree found having leaves like the other; and the same tree is almost as variable in its different branches. The downy black oak, Q. triloba, is from twenty to forty feet high, according to Michaux, of very rapid growth, and extremely well calculated for inclosing land. The barren oak, or black jack of the Virginians, Q nigra, is of low growth, especially in the more northern states; it hears very abundantly, and furnishes a fine mast for hogs; the wood is small, but excellent for fuel. The black oak, or Quercitron, Q. tinctoria, is one of the largest trees of the American forest, and highly valuable on account of its timber as well as bark, which is very superior for tanning to any other oak. Q.falcata is a very large tree, commonly called Spanish oak. The wood of the upland white oak, or iron oak, is of great value in ship-building. The fruit of the \(Q\). Prinus, known by the name of the chesnut white oak, swamp chesnut oak, and, in the southern states of North America, white oak, is large, and of a sweet taste. The bark of the rock chesnut oak, \(Q\). montana, is excellent for tanning. The yellow oak, \(Q\). castanea, is a large and beautiful tree with eateable acorns.
2001. Liquidambar. From this tree tlows a strong balsamic substance, which has been compared to ambergris, and named from \(A m b a r\), amber, and liquidum, iluid, L. styraciflua, in its general form and leaves, bears a considerable resemblance to the lesser Maple, (Acer campestre) as the wood is good timber and beautifuliy variegated. Between the wood and the bark issues a fragrant gum, which trickles from the wounded trees, and by the heat of the sun congeals into transparent drops, which the Indians chew as a preservative to their teeth. It smells like the balsam of Tolu. The species are propagated by layers, or from seeds.

The sweet gum-tree, or Liquidambar styraciflua, is sometimes found of an immense size, particularly in the southern states; its wood is of an exquisite hard texture and tine grain, and furniture made of it has a handsome appearance.
2002. Platanus. From \(\pi \lambda \alpha \tau \varepsilon\), ample, broad, in allusion to the shadow afforded by the foliage. The species are trees of peculiar grace and elegance, and from that circumstance, and the classical associations attached to them, they are eminently adapted for pleasure grounds. The chenar, or eastern plane, is very much employed

13432 Leaves oblong sinuate serrated downy beneath, Bark fungous

and Miscellaneous Particulars.
in the gardens of Persia and India; it was highly esteemed by the Greeks and Romans, and was planted near their houses in the form of avenues and groves. Groves of these trees are still equally revered in India, and are commonly found near the native temples and burial places of the princes. The timber is considered of similar quality to that of sycamore. All the species are of easy culture by layers, and they will also grow by cuttings.

The Platanus occidentalis is known in America by the name of the button-wood, water beech, sycamore, and plane-tree; in Canada it is called cotton-tree. It is, perhaps, the largest tree in North America; on the fertile banks of the Ohio and Mississipi there are trees measuring from ten to sixteen feet in diameter.
2003. Salisburia. So called in honor of Richard Anthony Salisbury, F. R. S., a modern distinguished botanist. A large tree remarkable for its fan-shaped leaves, cloven like some of the Adiantum species. The fruit is a pale brown drupe of a globular form ; it has never been produced in this country, though there are trees of a considerable size. The fruit is yellow when ripe, with a fleshy, juicy, white pulp, adhering closely to the drupe, which is like that of an apricot. The kernel is white, rather firm, sweet, with a mixture of austerity or bitterness when raw, but agreeable when roasted. Dr. Abel says, he saw the fruit exposed in the markets in China, but could not find out to what purpose it was applied.
2004. Carludovica. Named by the authors of the Flora Peruviana, in honor of Charles IV., king of Spain, and Luiza, his queen; both of whom were noble patrons of botany, and deserving of a finer genus to commemorate their virtues. The species are low palm-like herbs, of little beauty, but of great hotanical interest.
2005. Caladium. A name originally employed by Rumphius, to designate some species of Arum, and revived by Ventenat. Its meaning is unknown. The species have the appearance of Areca, and are only cultivated for their singularly spotted stems, or neat green leaves, which are rarely disfigured by any of the accidents to which other stove plants are liable. The species are plants of the same general appearance as Arum. C. sagittifolium, Chou-de-Bresil, Fr, and Essbare Arum, Ger., bears a near resemblance to Arum Colocasia, and is carefully cultivated in the West Indies for the leaves, which are boiled and eaten as coleworts, being extremely pleasing to the taste. The roots are also eaten there, but they are in less esteem than the leaves. This is generally supposed to be the species of the Arum family the most universally cultivated. It is found in the East and West Indies, China, Japan, New Zealand, and the South Sea Islands. The root is extremely acrid, and when eaten raw, will excoriate the mouth; but baked in hot ashes, it looses its acrimonious quality, and becomes mild and well tasted; it is, however, heavy on a weak stomach, and is apt to occasion costiveness. The leaves, which are very soft, glaucous, and covered with a very fine silky nap, are used in many places instead of plates and dishes.

History, Use, Propagation, Culture,
2006. Arum. Formerly aron; supposed to be an ancient Egyptian word by which the A. colocasia was known. The last mentioned name is an alteration of its Arabic denomination qolqâs, according to Forskahl Perennial herbaceous plants, mostly natives of hot climates. The roots are fleshy, hot, and acrid, but in many species eatable; they are generally without stems, and altogether, with the Caladiums, form a very singular family. A. Dracunculus, Serpentaire, Fr., Drachenwarx, Ger., and Dracunculo, Ital., is a very remarkable plant; the stalks of the leaves being spotted with brown and purple, like the belly of a snake. The flower, which, like others of the genus, has a very singular appearance, smells so strongly of carrion, that few persons can endure it. It might be used in medicine and domestic economy for the same purposes as A. maculatum. A. Colocasia has a tuberous thick large oblong root, and Jeaves resembling those of the water-iily. In Egypt and the Levant, this plant is esteemed a wholesome food, though not very delicate. The roots and petioles are boiled, and the leaves when young are sometimes eaten raw. A. trilobatum, and various others, are similarly used in the West Indies. There and in Europe the culture of all the species is of the simplest kind.
A. maculatum, Gouet, Fr., Aronswartzel. Ger., and Aro, Ital., has a tuberous whitish root about the size of a large nutmeg, which is used both as food and medicine. On tasting them, they seem to be merely mucilaginous and insipid, but they soon affect the tongue with a pungency as if pricked by needles; this uneasy sensation may be alleviated by milk, butter, or oil. The acrimony is lost in drying, and the roots become farinaceous, insipid, and fit for boiling or baking. In the Isle of Portland, where the plant is very abundant, the roots are gencrally eaten by the country people; they are macerated, steeped, and the powder so obtained is dried and sent to London, and sold urider the name of Portland sago. Medicinally, the root in its recent state is stimulant, diaphoretic, and expectorant. Though retained in the Materia Medica, it is seldom used. The berries which succeed the flower are devoured by birds; and Mr. Curtis thinks, that even the roots are eaten by them, particularly pheasants. Dried and powdered, they are used by the French as a wash for the skin, under the name of cypress powder.
2007. Caryota. The Greeks gave this name to a kind of cultivated date. Pliny says, it was so called,

15461 Leaves pedate entire, Spadix cylindrical shorter than ovate flat spathe, which is hairy inside
13462 Leaves pedate entire, Spadix lanceolate shorter than the ovate flat smooth spathe
13463 Leaves pedate entire, Spadix subulate longer than the oblong convolute spathe
13464 Leaves pedate entire, Spadix shorter than lanceolate spathe
13465 Stemless, Leaves ternate entire, Spadix clavate shorter than ovate acuminate flat stalked spathe

13496 Fronds pinnated, Leaflets linear acute, Fruit oblong incurved

and Miscellaneous Particulars.
because a wine was prepared from it which soon got into the head, \%opa, head. C. urens, a fine species of palm, produces flowers in long pendulous spikes, which are succeeded by strings of succulent globular berries, dark red when ripe, with a thin skin, soft pulp, and very sharp and acrid to the taste. In Ceylon, it yields a sort of liquor, sweet, wholesome, and no stronger than water. It is taken from the tree twice or thrice a day, and an ordinary tree will yield three or four gallons. They boil this liquor, and thus make a kind of brown sugar of it, called Jaggory. The fruit is not eatable. When the tree has come to maturity, there comes out a bud from the top; this bud they cut and prepare by putting salt, pepper, lemons, garlick, leaves, \&c. over it, which keep it from ripening. They daily cut off a thin slice from the end, and the liquor drops into a vessel, which they set to catch it. The buds, like those of the Cocoa and Betel-nut, are excellent in taste, resembling walnuts or almonds. C. mitis is a very beautiful palm, with fronds four feet long and a branched spike of flowers, succecded by berries, round, coriaceous, smooth, black, the size of a musket bullet, but not eatable. Both species grow freely in sandy loam.
2008. Nipa. The name given to this fine palm in the Moluccas.
2009. Areca. The name which this palm bears in Malabar is, when it is an old tree, Areec; when young it is called Paynga. A. Catechu produces the nut which is cut in slices, wrapped in the aromatic leaves of the betel-pepper, and chewed as we do tohacco. These leaves are previously covered with a thin layer of shelllime (Ehunam), to preserve the flavor longer in the mouth. In most parts of the East Indies the natives are continually chewing it, swallowing their saliva tinctured with the juice, and spitting out the rest. The inside of their mouths appears as red as blood, and it gives their teeth a dark color : but it preserves the teeth, sweetens the breath, and is a stomachic and diuretic. This palm is very generally cultivated in the East Indies.
A. oleracea is the highest of the American palms, and is very distinct from the East Indian Areca. The sheaths of the leaves are very close, and form the green top of the trunk a foot and a half in length. The

inhabitants cut off this top, take out the white heart of two or three inches in diameter, consisting of the leaves closely folded together, and eat it, citier raw with pepper and salt, or fried with butter like the artichoke.
2010. Belis. Named by R. A. Salisbury, in the Transactions of the Linnean Society, from \({ }^{6}\) ERos, a javelin, on account of the form and texture of the leaves, which are not unlike a javelin head. B. lanceolata is a beautiful evergreen shrub, with distichous neat leaves, easily cultivated in any good conservatory.
2011. Agathis. From ara.9/s, a cluster, because the flowers are collected in clusters. This genus is formed of the Dammar Pines, of which the A. australis, or New Zealand Cowdie Pine, is one of the finest trees in the world, often growing perfectly straight to the height of 100 feet or more, and yielding one of best descriptions of wood for masts.
2012. Pinus. This name is of Celtic origin, and is the same in all the dialects of that tongue. Pin or pen, a rock or mountain, has given rise to pin, in Armorican; peinge, in Erse; pinua, in Welsh; pinu, in AngloSaxon; pine, in English; pynbaum, in German; all signifying the fir-tree : hence also the Appennines (Alpes pennines), Pennafiel, Pennaflor, \&cc. towns of Spain embosomed in mountains. The fruit of P. Pinea was formerly called Nux pinea, the pine nut. Pinaster is Pliny's name for the wild pine. Cembra is an alteration of the word cembro or cirmolo, the name given by the inhabitants of Trentin and Valteline to the plant. Tæda is derived from the Greek \(\delta \infty 5 \delta \infty \delta 05\) which signifies a torch, for which the wood of P. tada is particularly adapted. Strobus is a name employed by Pliny for an eastern tree, which was used to perfume apartments. The moderns have applied it to a noble North American species.

The trees which compose this genus are not less remarkable for their grandeur and beauty, than for their valuable timber. They are all evergreens, and of lofty and erect growth. The trunk of the Scotch pine is more generally employed and more universally applicable as timber than any other tree in the temperate zone of the northern hemisphere. P. sylvestris, Pin, Fr, Keifer or Fohre, Ger, and Pina, Ital., is erroneously called a fir; and has the term Scotch applied to it, because it is the only species of the genus indigenous to Britain, and there only in the northern parts of Scotland. It is also indigenous in the Alps, in the north of Germany, Russia, and abundantly so in Sweden and Norway. The finest pine woods in Britain, are at Invercauld in Inverness-shire, and Gordon Castle in Aberdeenshire. The timber of the Scotch pine is the red or yellow deal of the north of Europe, and is the most durable and valuable of any of the genus, unless we except, in point of durability, the larch. That grown in cold elevated situations in the highlands of Scotland, is found to be not inferior in quality to any imported from Norway; but that which has been planted in the low districts, is greatly inferior in point of durability, and can seldom be used in house carpentry and joinery. The tree is of great value as a nurse plant to others less hardy. The trunk of the tree produces resin by incision, and the roots tar by distillation. Several varieties of the wild pine have been noticed by botanists. According to Sang, the variety commonly cultivated is least worth the trouble. "The \(\mathbf{P}\). sylvestris, var, montana," he says, \({ }^{6}\) is the variety which yields the red wood: even young trees of this sort are said to become red in their wood and full of resin very soon. The late Mr. Don, of Fortar, exhibited specimens of cones of each variety to the Highland Society of Scotland, and likewise to the Caledonian Horticultural Society. The variety preferred by Don, is distinguished by the disposition of its branches, which are remarkable for their horizontal direction, and for a tendency to bend downwards close to the trunk. The leaves are broader and shorter than in the common kind, and are distinguishable at a distance by their much lighter and beautiful glaucous appearance.

134!)7 Fronds pinnated, Stems hirsute, Spadixes branched spiny, Spines incurved
13408 Fronds pinnated, Leaflets plaited bitten off, Stems and spadixes branched smooth, Fruit roundish gibtous
13499 Leaves solitary lanceolate flat spreading, Cones round, Scales acuminate

\section*{13500 Leaves elliptical lanceolate striated}

13502 Leaves in pairs rigid, Cones conico-ovate acute as long as the leaves, generally in pairs
13503 Leaves in pairs, Trunk ascending, Cones ovate erect
13504 Lvs. twin very long of two forms, Cones ovate, Scales narrowed at base very thickened at end not angular 13505 Leaves twin short acute, Cones ovate conical, Prickles of scales long subulate incurved : lower reflexed
13506 Leaves twin divaricating oblique, Cones recurved twisted, Crest of anthers dilated
13507 Leaves double or triple rigid, Cones oblong generally in pairs rounded at base
13508 Leaves twin roughish at edge, Cones oblong conical shorter than leaf narrowed at base, Scales echinat.
1350 Leaves twin: the first ciliated, Cones ovate blunt somewhat unarmed longer than leaf, Nuts hard
13510 Leaves twin very fine, Cones ovate-conical very smooth solitary stalked
13511 Leaves twin, Cones ovate-conical rounded at base somewhat shorter than leaf, Scales blunt
13512 Leaves twin, Cones oblong-conical the length of leaves solitary rounded at base, Scales echinate
13513 Leaves twin, Cones ovate-conical rounded at base solitary half as short as leaves, Scales unarmed
13514 Leaves twin or ternate, Cones ovate-conical subsolitary, Prickles of scales incurved
18515 Leaves long, Cones deflexed: spines inflexed, Sheath of leaves long
13516 Ieaves in 5s very long slender lax toothletted, Cones cylindrical smooth pendulous longer than leaves 13517 Leaves 3 very long, Cones roundish ovate mucronate
13518 Leaves 3 , Cones ovate clustered, Spines of scales reflexed, Sheath of leaves short

and Miscellaneous Particulars.
The bark of the trunk is smoother than in the common kind. The cones are thicker, and not so much pointed. The plant is more hardy than the common sort, grows freely in almost any soil or situation, atad quickly arrives at a considerable size."
\(P\). laricio is said to be neariy allied to the Scotch pine, but a much handsomer and finer tree. Professor Thouin considered it equally hardy with \(P\). sylvestris; its wood is more weighty and resinous, and consequently more compact, stronger, and flexible. It grows wild on the summits of the highest mountains in Corsica. P. resinosa, the red Canadian pine, is not unlike the Scotch pine, but rather redder in the bark. The timber of this tree is frequently imported as masts, and is considered valuable. Grown on a damp and fertile soil, it is much less durable than from elevated situations; it is equally hardy with \(P\). sylvestris. \(P\). pinasier is a grand and picturesque tree, and is a great favorite with the Roman and Florentine painters. The timber is of less value than that of any of the others that have been mentioned; in Switzerland it is cut into shingles for covering their houses. It is highly deserving of culture as an ornamental tree, but not for timber.
P. Pinea is very common in the south of Italy; there is an immense forest of them at Ravenna, and they are much planted in the gardens of the villas of Rome and Florence. The seeds of this and the last species are eaten throughout Italy, both by the poor and rich. They are as sweet as almonds, but with a slight flavor of turpentine. The wood is not so resinous as that of most of the other sorts, and the tree can only be considered as deserving culture for its pictorial effect. P. Cembra, the Tannenbaum of Lord Byron (Childe Harolde), and the Aphernousli pine of Harte (Essays), grows higher up the Alps than other pines, and is even found at elevations where the larch will not grow. The wood is very soft, and having scarcely any grain, is very fit for the carver. The peasants of the Tyrol, where this tree abounds, make various sorts of carved works with the wood, which they dispose of in Switzerland among the common people, who are fond of the resinous smell which it exhales.
P. Tæda has longer leaves than the wild pine, and larger cones than P. Pinea; the timber is like that of the Scotch pine, but has more resin. There are a number of these trees at Woburn Abbey, which grow as freely as the Scotch pine, and the timber, as far as it has been tried, is superior.
P. palustris is remarkable for the length of its leaves, which often excced a font, and hang down in tufts at the end of the branches, having a singular appearance. It grows in a warmer climate than most other pines; produces a valuable timber in America, but has been but little cultivated in this country. P. strobus forms the connecting link between the pine and the larch tribe, and is the tallest tree of the genus. The bark is smooth and elegant, and the leaves numerous, soft, and of a bluish green. The timber is imported in vast quantities under the name of white pine; it is much used in house carpentry, but is considered less durable than the red deal of Norway ( \(\mathbf{P}\). sylvestris), or the pitch pine of Canada (P. resinosa). The tree seems to be of so delicate a habit, as to prevent our expecting it ever to become very large or valuable in Britain. It has been \(a\) good deal culcivated, having formerly been supposed the most valuable tree of the genus, next to the common pine.
The Pinus canariensis seems never to have been well described or understood. Some have taken it for the Pinus Larix, others for the Pinus tæda, whilst others had confounded it with the Pinus maritima. Von Buch, and the late Christian Smith, named it in their catalogue of the vegctation of Teneriff, Pinus canariensis, and they state, that it inhabits that island from the edge of the sea to an elevation of 6700 Parisian feet above the level of the sea; but that the region where it is most abundant may be reckoned at from 4080

History, Use, Propagation, Cuiture,
to 5900 feet, where snow falls for about a month. The temperature of the zone \(\mathbf{M}\), Decandolle estimates to be similar to that of Scotland, or to the north of France, or of Germany. The wood is resinous, highly inflammable, and is excellent for constructing buildings, being known to continue sound for ages.

The Pinus inops, Jersey pine, pitch or scrub pine, is of middle size, straggling growth, and full of resin. Its branches are tougher than those of any other pine, and might be used for many purposes if its wood were not subject to so early a decay. The pitch pine, \(P\), resinosa, is generally known in its native country by the name of Norway pine; sometimes, particularly among the Canadian French, red pine. It grows in close forests, is very tall, and its bark remarkably smooth and red: the timber is very beavy; for which reason it is rejected for masts, though its shape and size appear to recommend it for that purpose. The scrub pine, P. Banksiana, is a small straggling tree, which in some instances, when growing among barren rocks, does not rise above five or eight feet high, though it will grow to a considerable size when by accident or culture it is brought on good soil : trees of this species now in England exude a great quantity of resin from their branches. The yellow pine, \(P\). variabilis, is most in use for building houses as well as shipping. P. tæda, the loblolly or Oldfield pine, is found in large tracts in the southern states of North America: all the woods seem to be filled with its seeds; for when any piece of cleared land is neglected for any space of time, it will be covered with these pines. It is difficult, and in some cases almost impracticable, to recover lands so run over, as the ground appears to have lost all fertile properties for other vegetation. The long leaved, yellow, pitch, or brown pine, \(\mathbf{P}\). palustris, is a beautiful as well as very useful tree. The white or Weymouth pine grows in the state of Vermont to an enormous size; it is the best timber in America for masts.
2013. Abies. According to Bullet, this name is derived from one of the dialects of the Celtic, abetoa, whence abete, Italian, abeto, Spanish, \&c. Hesychius, the Greek grammarian, calls it \(\alpha\) bev.

Abies communis, Sapin, Fr., Fichtenbaum, Ger., and Abiete, Ital., is one of the tallest of European firs, with a very straight but not thick trunk. It is a native of the north of Germany and Russia, and particularly abundant in Norway; its timber being the white deal, and, at an earlier age, the long spars imported from that country and the Baltic. The timber is inferior to that of the common pine in durability and bulk; and being often knotty, is not proportionally strong for horizontal bearings with that timber. White Norway deal, however, is used for a great variety of purposes in building; and the entire trees are more prized than any other for masts for small craft, for spars both for marine parposes and on land. What constitutes the value of this fir is, that its timber is equally durable at any age, like that of the larch; and what renders it peculiarly adapted for masts, spars, scaffolding, poles, \(\& \mathrm{c}\). is its habit, almost in every case, whether standing single or detached, of growing perfectly erect and straight. The tree may be cut for rods, stakes, and scythes, or other implement handles, when the trunk at the base is not more than two inches in diameter, and the bark being kept on it, it will prove almost as durable as the larch. Pontey says, that poles of spruce are so far inferior to those of larch, that they are more apt to crack when exposed whole to the influence of the sun and air : but in ali other respects they are nearly equal to it, and in straightness surpass it. The tree is peculiarly valuable as a nurse, from being evergreen and closely covered with branches, by which radiated heat is retained; from its conical shape and rigid stem, by which it does not suffocate or whip the adjoining trees; from its being valuable at whatever age it is thinned out ; and from its being an excellent shelter for the most valuable game, It will not, however, grow in elevated situations, where the common pine and larch will flourish. It is also an excellent hedge plant for shelter, but is deficient in point of defence and durability. By incision, it yields a resin, from which, by various preparations, turpentine and Burgundy pitch are formed. The tops or sprouts give the flavor to what is called spruce beer.
A. alba, rubra, and nigra, are American firs of the spruce kind, resembling in their general properties those of Europe The black spruce is reckoned the most durable: in America it is used for knees for ship-building, where neither oak nor larch can be easily olstained. These knees are not prepared from two diverging branches, as in the oak, but from a portion of the base of the trunk connected with one of the largest diverging roots. The timber of the red spruce is universally preferred throughout the United States for sail yards, and, indeed, imported for this purpose into Liverpool from Nova Scotia, where it is also used for constructing casks for salted fish. It is chiefly from the decoction in water of young shoots of the black spruce, and not exclusively from those of the white species, as supposed by Lambert, that the celebrated beer is prepared by fermentation, with a due proportion of sugar and molasses. The essence of spruce of the dealers is prepared by evapolating this decoction to the consistence of honey.
A. picca displays a more stable and majestic form than any of the firs. The upper surface of the leaves is of a fine vivid green, and their under surface lias two white lines running lengthwise on each side of the

and Miscellaneous Perticulars.
mitrib, giving the leaves that silvery look which has given rise to the name. The timber is reckoned much inferior in value to that of the common pine, or of the white spruce. It should not be cut till after forty or fifty years growth; at this age, if it has grown in a sheltered rocky steep or dell, it will be found to have produced a great bulk of timber. It is more prolific in resinous matter than any other tree of the fir kind.
A. balsamea is a tree of more delicate habits than the silver fir: its timber is of little value, and the balm or resin procured from it possesses no medical properties superior to those of common turpentine, During summer, the tree sends out a pleasing terebinthinate odor.
A. canadensis is a drooping low evergreeu tree, elegant in appearance, and valuable as growing under the shade or drip of other trees.
All the species of the pine, fir, and larch families, with the exception of one or two, as yet rare in this country, are raised from seeds. The cones are gathered in the winter season, and exposed to the sun, or to a gentle heat on a kiln, in order to facilitate the separation of the seeds. The cones of the cedar should be kept for a year at least after they are taken from the tree, before the seed be attempted to be taken out. This is necessary on account of the soft nature of the seeds, and the great quantity of resinous matter which the cones contain when growing, and which is discharged by keeping. Cedar cones are generally imported from the Levant, and the seeds retain their vegetative powers for many years. The cones of the Scotch pine, spruce, and larch, are the principal kinds which are opened by kiln heat. The cones of the Weymouth pine, silver fir, and balm of Gilead fir, give out their seeds with very little trouble. April is the best season for sowing all the species. The soil should be soft and rich, well mellowed by the preceding winter's frost and snow, carefully dug and raked with a long toothed rake as finely as possible. The rarer sorts are generally sown in pots, but the more common in beds. The manner of sowing is by first drawing off the surface of the bed to the depth of half an inch; then drawing a light roller along it to render the surface perfectly even; next depositing the seed; and afterwards replacing the earth drawn off with a spade as evenly as possible. This is what is technically called bedding in, and is one of the nicest operations of nursery culture. The seed of the Scotch pine and Pinaster require a covering of half an inch in depth; those of the Weymouth pine, three quarters of an inch ; and those of the stone pine, an inch and a quarter. The Cedar is generaliy sown in broad pots, or boxes of light sandy loam, and covered half an inch. The seeds of the larch require a covering of only a quarter of an inch ; those of the spruce fir, an inch; those of the silver fir and balm of Gilead fir, from hall to three quarters of an inch. The seeds of the American spruce fir are smaller than those of any of the preceding kints, and therefore require a lighter covering than any of them; one-fifth of an inch is quite sufficient. The strictest attention is required, both in regard to quality of soil, and thickness of covering the seed; for though resinous trees are extremely hardy when grown up, yet they are all very tender in infancy. In sowing the seed, a considerable loss will be sustained by the suffocation of young plants if it is deposited too thick, and by the want of plants if too thin. The judicious gardener will be regulated by the goodness of the seed, and the size of the foliage of the different species. The raising regular crops of the pine family is reckoned a master piece of nursery culture in the open ground; and as it has been most extensively practised in the Scotch nurseries, it is generaily considered as best understood there. (See Sang. Plant. Kal.)

The pine, fir, and larch families benefit less by transplanting in the nursery than the non-resinous trees. And in general, where circumstances admit, the better plan is to remove them at once from the seed-bed at two years old, to where they are finally to remain. The more delicate species, including the cedar and most of the pines, are best transplanted into pots, unless they can be placed at once where they are to remain. The more common pines and firs are transplanted at two years of age into nursery lines, about the middle of April for all the tribe, excepting the larch, which, being deciduous, should be transplanted in February. No description of tree-plants receive so much injury as this tribe from the loss of roots, from the roots being exposed to the air by being kept long out of the soil, or from compression and exclusion of air and moisture by being kept in close bundles, or thick layers. They should, therefore, be finally planted as soon as possible after removal from the nursery; and, indeed, whenever it is practicable, no more should be taken up in one day than can be planted that day or the next. Nor are any plants more easily deprived of the vital principle, by packing and carriage either by sea or land; though, being all evergreens, excepting the larch, they do not readily show it. This has been stated to us by experienced planters in Wales and different parts of England, as the reason why so few trees are finally produced from the immense numbers of Scotch pine and larch fir annually sent to the south by the Scotch nurserymen.

Abies Balsamea forms an elegant tree forty or fifty feet high. It grows in high and cold situations in the northern states of North America, where it is called balsam of Gilead fir, fir balsam, and American silver fir

\section*{History, Use, Propagation, Culture,}

The hemlock spruce is a very elegant tree, and grows in some situations to an enormous size : its bark is a tine substitute for oak-bark in tanning.
2014. Larix. This has also for its root the Celtic word lar, which signifies fat, in allusion to the abundance of resin afforded by the plant. Even Dioscorides remarks, that Larix is the Gallic name for resin. The authors of the Dictionary of Trevona make the word Cedrus come from \%uwins, sweet-scented, on account of the balsamic odor exhaled by the wood when burned.
L. Cedrus, Cédre, Fr., Cederbaum, Ger., and Cedro, Ital., is unquestionably the most celebrated tree of the genus, and not less remarkable for the irregular grandeur of its form. The general character of its shoot, even when the tree is young, is singularly bold and picturesque, and quite different from that of every other species of the tribe. It is a native of the coldest parts of the mountains of Libanus, Amanus, and Taurus; but it is not now to be found in those places in great numbers. Maundrell, in his journey from Aleppo to Jerusalem, in 1696, could reckon only sixteen large trees, though many small ones; one of the largest was twelve yards six inches in the spread of its boughs. The forest of Libanus never seems to have recovered the havoc made by Solomon's forty score thousand hewers: so that we have now, as Professor Martyn observes, probably more cedars in England than there are in Palestine.
From the branchy head of this tree, and its aversion to pruning, it is not likely ever to become valuable as timber in this country. When planted for that purpose, it should, as Sang recommends, be sown in groves, and thus by proximity drawn up with few branches. Much has been said of cedar timber, which borders on the miraculous; as far as experience has gone, it is greatly inferior to that of the common larch, or the wild pine. The great use of the cedar is to plant singly on lawns, or in the margin of plantations, where one or two specimens will give force and character to the dullest front of round-headed trees.
L. Communis, Meleze, Fr., Lerehenbaum, Ger., and Laricio, Ital., is a deciduous tree, and there are two or three species or varieties not yet distinctly ascertained. There is a variety with red and another with white flowers; one with cinerous bark, called the Russian larch, and one with pendulous branches. L. pendula and L. microcarpa are considered species or subspecies; the timber of both is said to be harder than that of the common white larch; but these trees have never yet had a fair trial in this country. As there are a few large specimens at Dunkeld and Athol, seeds will probably soon be obtained, and from their progeny a practical estimate may be formed of their merits in this country. The red larch trees on the Athol estates do not contain one-third as many cubic feet of timber as the white larch of the same age. The wood is so ponderous that it will scarcely swim on water. (Hort. Trans. iv. 416.) The timber of the white larch has been as much extolled as that of the cedar, and with much more reason. The rapidity of its growth is not less remarkable than the durability of the timber. Both have been experimentally proved in the Highlands of Scotland. It is stated by the Duke of Athol, that on mountainous tracts there, at an elevation of 1500 or 1600 feet, the larch, at eighty years of age, has arrived at a size to produce six loads ( 300 cubic feet) of timber; appearing in durability and every other quality to be likely to answer every purpose both of civil and naval architecture. (Hort. Trans. iv. 410.) The tree will arrive at a timber size in almost any situation or soil. Sang, a forest manager of extensive practice, has paid great attention to this tree. "It bears," he says, "the ascendancy over the Scotch pine in the following important circumstances: that it brings double the price, at least, per measureable foot; that it will arrive at a useful timber size in one-half, or a third part of the time, in general, which the pine requires; and, above all, that the timber of the larch, at thirty or forty years old,

and Miscellaneous Particulars.
when it has been planted in a soil and climate adapted to the production of perfect timber, is in every respect superior in quality to that of the pine at 100 years old. In short, it is probable, that the larch will supersede the Scotch pine in most situations in this island, at no very distant period."

The chier objections to the timber of the larch are its liability to warp and twist; but this Monteath and others have proved may be effectually prevented by barking the trees in spring while growing, and not cutting them down till the following autumn, or even for a year afterwards. This is also said to prevent the timber from being attacked by the dry rot. The bark of the larch is more than half as valuable as that of the oak in tanning; turpentine is extracted from it in the Tyrol by incision; but that being always injurious to the timber, can never be recommended for adoption in this country. (See Encyc. of Gard. 7053. Monteath's Forester's Guide, 2d edit. p. 234.)
Like all other trees, and especially the resinous tribe, the timber of the larch is much affected by climate and soil. A certain elevation of surface, coldness of climate, and inferiority of soil, is absolutely necessary to produce the timber in perfection. Sang has known it in many places make the most rapid progress for thirty or thirty-five years, and though there was no external signs of disorder, yet when it was felled, the wood had begun to rot in the hearts of the trees, and some were quite hollow a good way upwards. (Plant. Kal. 59.)

Larix pendula, black larch, Tamarack or Hackmatack of the Americans, is a beautiful tree, resembling the European larch in appearance, as well as in the excellent qualities of its wood and bark.
2015. Schubertia. Named in honor of M. Schubert, a Polish botanist. The deciduous cypress grows in extensive swamps, and on the banks of large rivers, from Indian river, Delaware, to Florida, and on the Mississipi ; it is one of the largest trees of the new continent, and one of the most valuable timbers that country produces ; it grows to a considerable height in this country, though the extremities of the young shoots are almost every autumn destroyed by frost. The finest specimens are at Sion-house and Blenheim.
2016. Podocarpus. From tres zoסos, a foot, and zag;os, fruit; in allusion to the stalk of the fruit. The species are increased by ripened cuttings in sand under a hand-glass.
2617. Cupressus. In Greek چvт๙erの号, from the isle of Cyprus, where this tree is very abundant. Cupressus sempervirens is a common timber tree in some parts of the Levant. It was employed by the Moors round their palaces, and both by the ancient and modern Romans in their villas and gardens. The timber of this tree is said to resist the worm, and to be of great durability. The doors of St. Peter's church at Rome were formed of this material, and have lasted eleven hundred years. The Greeks made their coffins of it ; and the mummy chests of Egypt are many of them of this wood. In Crete, Malta, and other places, it is used for the common purposes of building, and when imported into this country it is employed by the cabinet-maker and turner. Near buildings, where the prevailing architectural lines are horizontal, it forms very suitable combinations: it is also considered an appropriate tree for burial places. C. Thyoides is an abundant tree in the swamps of New Jersey and Pennsylvania. It is used for fencing and house-building, and is in the highest esteem for shingles and pipe staves. C. lusitanica is a native both of Goa and Japan, and the handsomest tree of the genus. It is easily distinguished from all the evergreens of the Coniferæ by its abundance of very long dichotomous pendent branchlets. The culture of the hardy species of this genus, and also of Thuja, is the same as that of Pinus.
2018. Thuja. An alteration of thya, its real name; from \(\mathcal{V} \nu \omega\), to sacrifice. Its wood, which gives out when burnt an agreeable perfume, was used in sacrifices. Thuja occidentalis, Cédre blanc, Fr., is a well known

History, Use, Propagation, Culture,
popular evergreen, which, thongh it seldom rises above the height of a shrub here, yet in Upper Canada attains the height of a timber tree, and the wood is considered more durable than any other. The trunk is sawn up into planks and boards for houses and boat-building, and the branches used for posts and fencing. The smaller branches and spray form besoms, and the leaves, made into a salve, are used by the Indians to cure the rheumatism. In England, the timber has been chiefly employed by the turner and cabinet-maker. In its native country the Arbor-vitæ succeeds best in soils where the roots have abundance of moisture. It grows tallest in swamps and marshes; in very dry places it never comes to any degree of perfection. The first tree of this species sent to Europe, was planted in the royal garden of Fontainbleau, in the reign of Francis the first. T. orientalis is a shrub resembling the other in general appearance. Both these species are readily increased by seeds, cuttings, or layers.
 of which the five outer are reversed and acute, the five interior ciliated. T. Anguina is a popular annual, with the habit of the common cucumber. The flowers are cut into many small threads, and the fruit is taper, and neanly a foot long. T. cucumerina has smooth fruit of a red or orange color, the size of a pear. In the popular medicine of Malabar, the seeds are used for disorders of the stomach and bowels. Culture as for the common gourd.
2020. Monordica. From mordeo, momordi, to chew; its seeds have an irregular rugose surface, and the appearance of having been chewed. M. elaterium has a large fleshy perennial root, somewhat like that of Bryony. The stems are thick, rough, trailing, branching, with rough leaves on long footstalks. The fruit is an inch and a half in length, swelling like a cucumber, of a grey color like the leaves, and covered with short prickles. When fully ripe, it quits the peduncles, and casts out the seed and juice with great force and to a considerable distance through the hole in the base, where the footstalk is inserted. For medicinal use, the fruit is gathered in September, just before it is ripe; and the clear juice which runs from it and that obtained by the expression of the fruit are inspissated, and form the elaterium of the shops. This fruit is a very violent cathartic. It was much employed by the ancients, who regarded every part of the plant as purgative; but Dr. Clutterbuck has proved that this is an error. (Thomson's Lond. Disp. 388.)
M. balsamina has a fleshy ovate fruit, remotely tubercled in longitudinal rows, smooth in the other parts, red when ripe, bursting irregularly, and dispersing the seeds with a spring. This fruit in Syria is famous for curing wounds. They cut it open when unripe, and infuse it in sweet oil, exposed to the sun for some days, until the oil is become red. It may then be applied to a fresh wound dropped on cotton. M. operculata has a green fruit, the top of which falls off when it is ripe like a lid; within it has no pulp, but is dry, and fillerd with netted fibres, very much interwoven.
2021. Cucurbita. A Latin word signifying a vessel. It is said to be derived from the Celtic cuce, a hollow thing. C. lagenaria has a fruit shaped like a bottle, with a large roundish belly, and a neck very smooth; when ripe of a pale yellow color, some near six feet long and eighteen inches round; the rind becoming hard, and being dried contains water; seeds quadrangular oblong, cut off and emarginate at top, three-cornered and beaked at bottom; edge keeled with a double raised line, smoothish, of a pale bay color. The Arabians call the bottle gourd Charrah. The poor people eat it boiled, with vinegar, or fill the shell with rice and meat, and thus make a kind of pudding of it. It grows in all parts of Egypt and in Arabia, wherever the mountains are covered with rich soil. In Jamaica, the shells are generally used for water cups, and frequently serve for bottles among the negroes and poorer sort of white people in the country. A decoction of the leaves

13550 Branches compressed, Lvs. imbricated in 4 rows lanc. acute appressed warted under end, Cones 4-comered 13551 Branches round, Leaves imbricated in 4 rows oblong appressed smooth, Cones 4 -cornered roundish

13552 Fruit rounded oblong incurved, Leaves cordate repand mucronate toothletted
13553 Fruit ovate acute, Leaves roundish cordate angular repand
13554 Fruit oblong acute, Leaves 5 -lobed palinated entire
13555 Fruit roundish ovate narrowed at each end angul. warted, Bract cordate toothed above midd. of pedunc.
13556 Fruit oblong acuminate angular warted, Bract cordate entire below the middle of the peduncle
13557 Fruit elliptical angular warted beaked, Beak deciduous forming a lid
13558 Fruit cylindrical oblong, Furrows chain-like, Bract cordate entire at the base of the peduncle
13559 Fruit elliptical hispid, Leaves cordate hispid blunt toothed, Stem without tendrils
13560 Leaves cordate angular 5-lobed toothletted downy, Fruit obovate striped with lines lengthwise
13561 Leaves cordate roundish obtuse downy toothletted with 2 glands at base beneath, Fruit woody clavate
13562 Leaves subcordate about 3-lobed cuspidate finely toothletted rough, Fruit globose smooth
13563 Leaves cordate obtuse about 5-lobed toothletted, Fruit roundish or oblong smooth
13564 Leaves cordate deeply 5-lobed : the middle lobe narrowed at base, Fruit roundish elliptical warted
13565 Leaves cordate deeply 5 -lobed : middle lobe narrowed at base toothletted, Fruit clav. ellipt. somew. warted 13566 Leaves cordate obtuse about 5-lobed toothletted, Fruit depressed umbonate tumid at edge
13567 Leaves 5-lobed, Lobes sinuate pinnatifid blunt, Fruit elliptical smooth
13568 Leaves multifid, Fruit globose smooth
13569 Leaves cordate 5 -lobed toothletted blunt, Fruit globose spiny muricated
13570 Leaves palmate sinuated, Fruit round echinate
13571 Fruit oval echinate, Leaves palmate sinuated, Stem angular

and Miscellaneous Particulars.
is recommended much in purging clysters; and the pulp of the fruit is often employed in resolutive poultices : it is bitter and purgative, and may be used instead of Coloquintida.
C. pepo, Patisson, Fr., has hispid branchy tendril stems, which in good soil will extend forty or fifty feet in a season, and cover an eighth part of an acre. The fruit is oblong, ovate, varying in form and size; some not less than four feet in circumference. In some parts of England the pompion (corruptly pumpkin) is sometimes planted by cottagers on dunghils, and suffered to trail at length over the grass of an orchard. When the fruit is ripe, they cut a hole on one side, and having taken out the seeds, fill the void space with sliced apples, adding a little sugar and spice, and then, having baked the whole, eat it with butter, under the name of pumpkin pie. On the continent the fruit, both unripe and ripe, is used in soups, stews, and fried in oil or butter. The tender tops of the shoots boiled as greens are much more delicate than the fruit. C. aurantia is more tender than the common pompion. The fruit is small, round, of a bright yellow when ripe, and may be used like those of the other species. C. verrucosa has a small round fruit, with a woody rind, In America it is gathered when half grown, and boiled to eat as a substitute for greens; but for this purpose this and most of the species are inferior to the succade Gourd.
C. melopepo, Potiron, Fr., Pfebin Kiibijs, Ger., and Popone, Ital., has a large fruit, reddish yellow or yellowish-white within and without, roundish, but often flatted at top and bottom; torulose, and sometimes warted. It is cultivated in America as a culinary vegetable. C. Citrullus, Pasteque, Fr., Wassermelone, Ger., and Cocomero, Ital., is readily disting'ished from all the other species by its deeply cut leaves. The fruit is roundish, large, smooth, often a foot and a half in length, with a white icy flesh, streaked with dark red and black seeds. It is much cultivated in the warm countries of Europe, and also in Asia, Africa, and America, for its cooling quality. It serves the Egyptians for meat, drink, and physic. It is eaten in abundance during the season, which is from the beginning of May until the overflowing of the Nile; that is, to the end of July or beginning of August. It is the only medicine the common people use in ardent fevers. For this purpose they have a variety that is softer and more juicy than the common sort: when this is very ripe, or almost putrid, they collect the juice, and mix it with rosewater and a little sugar. This fruit should be eaten by Europeans with great caution; when taken in the heat of the day, whilst the body is warm, colics and other bad consequences often ensue, and it is well known that persons are much troubled with worms at the time this fruit is in season.
The Succade Gourd, a variety of C. ovifera, has an elliptic oblong pale-yellow fruit, by far the best for culinary purposes of any species of the genus. When very young, it is good fried with butter; when about half grown, it is excellent either boiled as a substitute for greens, or stewed in slices with rich sauce; when full grown, it is used for pies. Sabine, who has cultivated most species of Cucurbita, considers the vegetable marrow without a rival. (Hort. Trans. vol. ii. 255.)
All the species may be raised on a hot-bed in April, and transferred to the open garden at the end of May, under a warm aspect and in a rich soil; or they may be sown in a trench filled with hot dung, where they are finally to remain. Their after culture is of the easiest description.
It is not very generally known, that the tender tops of all the species of the Cucurbita and Cucumis families, whose fruit may be caten, when boiled form a very tender substitute for greens.
2022. Cucumis. A word with the same derivation as the last. C. Colocynthis has fruit the size and color of urange ; the pulp light, spungy, and white, and most intolerably bitter. When ripe, it is peeled and dried in a stove, and in this state it is imported from the Mediterranean under the pame of coloquintida. Medicinally, it

is a very powerful drastic cathartic, requiring to be employed with caution, on account of its violent effects. When given alone, even in moderate doses, it purges vehemently, producing violent gripings, and not unfrequently convuisions and inflammations of the bowels. (Thom. Lond. Dzep. 271. C. sativus and Melo ( \(\mu \in \lambda a y\), an apple) are too well known to require farther notice in a work of this description. C. anguria has hispid angular stems, and small flowers like those of Bryony. The fruit is of the size and shape of a pullet's egg, of a dialstand islands, and is esteemed an agreeable and wholesome ingredient. C. prophe herbs in soups in the west fruit smaller than a melon; the odor nauseous, and the taste as bitter as Coloquintida. The fruit of C. acutangulus is very insipid, but in India is eaten boiled and pickled. C. Chate has a roundish fruit almost like that of the melon; the taste is somewhat sweet and cool, but not so cool as the water melon. In Egypt it is eaten as the most pleasant fruit they have, and that from which delicate persons have least to apprehend. The culture of all the species is similar to that of the common cucumber.
2023. Sicyos. इivevs was one of the Greek names of the cucumber, from owzos, unpleasant. The species are trailing plants like those of Cucumis, but with much smaller fruits.
2024. Bryonia. From beva, to push or grow rapidly, in allusion to the manner of its growth. B. alba and dioica, differ in little else besides the color of the berries, and by some are considered one species. Goats are

and Miscellancous Particulars.
the only quadrupeds said to eat this plant. The root grows to a vast size. Gerarde says, "the queene's chicfe chirurgeon, Master William Goodorous, shewed me a roote heereof, that waied halfe an hundred waighte, and of the bignesse of a childe of a yeere old." To this Linnaus ascribes the quickness of its growth, though it springs late. The roots have been formerly by impostors brought into an human shape, carried about the country, and shewn for mandrakes to the common people. The method which these people practised, was to open the earth round a young thriving Bryony plant, being careful not to disturb the lower fibres of the root; to fix a mould such as is used by those who make plaster figures close to the root, fastening it with wire to keep it in its proper situation, and then to fill in the earth about the root, leaving it to grow to the shape of the mould, which is effected in one summer. This root is a famous hydragogue, and highly purgative and acrid.
2025. Andrachne. The Greek name of the Purslane. The modern plant bears some analogy to that of the Greeks, in its thick and fleshy leaf. Plants of little beauty, and the easiest culture.
2026. Stillingia. Named after Dr. Benjamin Stillingfleet, an English botanist. S. Sebifera is the tallow-tree of China. An oil is expressed from the kernel, which hardens by cold to the consistence of common tallow, and by boiling becomes as hard as bees' wax. Stillingia sylvatica is considered a specific in cases of syphilis.
2027. Phyllanthus. From фuג入ov, a leaf, and avios, a flower, because the flowers grow upon the edges of the

History, Use, Propagation, Culture,
leaves. Many of the species of this genus are remarkable for the neatness of their foliage and general aspect. The abolished genus Xylophylla, which is now included in Phyllanthus, is very generally cultivated on account of the pretty and at the same time singular appearance of its leaffess leaf-like branches, covered over at the edges with multitudes of pink flowers. All the species require common stove culture.
2028. Aleurites, From \(\alpha \lambda\) stoc, flour, all the parts of the plant seeming to be dusted with a farinaceous substance. A handsome plant of easy culture, and ripe cuttings with their leaves untouched, root in sand under a hand-glass.
2029. Omphalea. A curtailment of Omphalandria, a name under which Dr. Patrick Browne, in his History of Jamaica, first described the plant. He formed it from orponos, a navel, and avne, a stamen; because the male organs are collected in a fleshy navel-like mass occupying the centre of the fowers. It grows freely in light loamy soil, and cuttings, with their leaves uninjured, root in sand under a hand-glass.
2030. Hippomane. From \({ }^{\prime} \pi \pi 05\), a horse, and \(\mu \alpha v \alpha\), madness; the name was given by the Greeks to a plant which grew in Arcadia, and which possessed the dangerous property of making horses furious. This Hippomane must not, however, be confounded with that of Virgil (third Georgic), which is an animal substance.
The Manchineel-tree grows to a vast size on the sea coast of the Caribbee Islands and neighbouring continent. The leaves are ovate, serrated, acute, and very shining. The fruit fall off from the tree spontaneously, and pave all the ground with their numbers. They are highly poisonous, and are said to be eaten by the sea-crabs, which collect about the trees in vast numbers. But this is supposed by Jacquin to be a vulgar error. The whole tree abounds with a white milk, which is highly poisonous, and so very caustic, that a single drop placed upon the skin instantly causes the sensation of a hot iron, and in a short space raises a blister. It is a common belief that to sleep beneath the branches is death; but Jacquin and his companions reposed under it for three hours at a time without inconvenience. The wood is a most beautiful material for furniture, being finely variegated with brown and white, and susceptible of a high polish. The workmen who fell the trees, first kindle a fire around the stem, by which means the juice becomes so much inspissated as not to follow the blows of their axes. Whole woods on the sea-coast of Martinique have been burnt, in order to clear the country of such a dangerous pest.

13020 Leaves 3-lobed

13601 Leaves oblong blunt very smooth, Flowers triandrous, Stem arborescent

13647 Leaves cordate angular
13648 Leaves palmate 11 -lobed smooth : lobes pinnatifid cuneate, Stipules setaceous multifid

and Mesccllaneous Particulars.
2031. Sapium. A name unaer which Pliny indicates a sort of pine, so named from the abundance of resin which it produces; from sap, fat or greasy in Celtic. The Americans employ the juice of Sapium aucuparium as bird-lime, for catching parrots and other birds. For this purpose they cut off a limb of the tree, and the next day collect the sap which has flowed out and become inspissated. They call it Mangle cautivo. The juice is also burned in lamps. Cuttings root freely in sand under a hand-glass.
2032. Croton. The Greek name of a certain insect called ricinus by the Latins, which the fruit of Croton resembles.
Croton Tiglium affords an oil used in medicine, which is so powerfully irritating, that a small drop placed upon the tongue, has the effect of exciting an irritation along the whole intestinal canal, which does not soon subside. It is usually employed in mixtuie with oil of almonds, in order to weaken its too violent powers. C. lineare in its general appearance resembles rosemary, and is called wild rosemary in Jamaica. C. tinctorium is used to dye both silk and wool of an elegant blue color, and the juice is used to color wines and jellies. The substance for this purpose is called Turnsol, and is made of the juice which is lodged between the calyx and the seeds : this, if rubbed on cloths, appears at first of a lively green, but soon changes to a blueish purple; if these cloths are put into water, and afterwards wrung, they will dye the water of a claret color; the rags theis dyed are brought to England, and sold in the druggists' shops by the name of Turnsol.
C. Eleuteria furnishes the Cascarilla bark, which is chiefly imported from Eleutheria, one of the Bahama Islands. It consists of pieces of about six or eight inches long, scarcely one-tenth of an inch thick, quilled, and covered with a thin whitish epidermis. It has a pleasant spicy odor, and a bitter warm aromatic taste. It is very inflammable, and is easily distinguished from all other barks by emitting, when burnt and extinguished, a fragrant smell resembling that of musk. Medically, this bark is a valuable carminative and tonic, and is an excellent adjunct to the Cinchona bark in fevers. C. lacciferum, a plant not yet in gardens, is one among several species on which the gum lac is said to be produced. Some of the spines we are in possession of, are much admired for their variegated leaves: all of them are freely propagated by cuttings with the leaves on, planted in sand, and plunged in moist heat under a hand-glass.
2033. Jatropha. From sexfoy, a remedy, and \(\varphi \sigma^{\prime} \omega_{\text {, }}\) to eat. The J. Manihot (Mandioka, Brazilian) or Cassa.

History，Use，Propagation，Culture，
root，yields an excellent nutritious article of food when the juice has been expressed，which is a strong poison． J．gossypifolia is considered a beneficial plant in the West Indies，on account of the seeds，which are much relished by and very nourishing to poultry．J．Manihot，the Cassava of the West Indies，and the Mandioca and Tapioca of Brazil，formerly supplied the greater part of the nourishment of the natives of South America， and is now very generally cultivated there and in the West Indies．It yields an agreeable wholesome food；is of rapid growth，the roots arriving to perfection in about eight months，and it will thrive in any soil or situa－ tion．The juice of the root is sweetish，and when swallowed，or when the root is eaten without preparation， it brings on convulsions，and occasions violent retching and purging．It acts only on the nervous system；it produces no inflammation on the stomach；but the stomach of a man or other animal poisoned by it，appears to be contracted one half．A little mint－water and salt of wormwood，timely administered，will prevent all bad consequences．In preparing the roots for use as food，they are washed，scraped，and grated to a pulp：this pulp is then pressed，and when dried is a powder resembling starch or flower fit for use．It is generally baked as bread，and bears a considerable resemblance to that made from wheat flour．The roots entire，or in a powdered state，form an article of considerable export from different parts of Brazil．All the species thrive well in our stoves，and are increased by cuttings，which Sweet states，succeed best when stuck in the tan in a good heat．

2034．Ricinus．A name with the same derivation as Croton，No．2032，which see．R．communis，though an annual and herbaceous plant in our gardens，becomes a tree in Africa of several years＇standing．In Candia it continues many years，and，according to Belon，requires a ladder to come at the seeds．The seeds furnish the well known Castor－oil of medicine．This oil is obtained both by coction and expression．The former method is performed by tying up the seeds，previously decorticated and bruised，in a bag，which is suspended in boiling water，till all the oil is extracted and rises to the surface，when it is skimmed off．Oil so obtained is apt to become rancid，and，therefore，the better mode is to subject the seeds to the press，in the same manner as is done with almonds to procure almond oil．（See Amygdalus．）The oil obtained is equal to one fourth of the weight of the seeds employed．It is often adulterated with olive oil，linseed oil，and poppy oil．The great value of castor oil as a purgative is the mildness and rapidity with which it operates．It is peculiarly adapted for infants，

13649 Leaves undivided 3-5-lobed palmate entire glaucous beneath

13675 Flowers diœecious: male spiked; female axillary, Invol. roundish entire, Leaves smooth lanc, subcord. 13676 Spikes male above; fem. below, Invol. cuneiform toothed at edge, Styles multifid, Lvs. obl. subcord. serr. 13677 Spikes axillary male above ; female below, Invol. cordate hispid, Leaves ovate acute hispid 13678 Male spikes axillary female at base, Invol. O, Leaves ovate cordate acuminate serrated
13679 Spikes axillary erect, Female invols, cordate toothed very large, Leaves ovate-lanceolate serrated smooth 13680 Flowers dicecious spiked, Spikes axill. Invol. of females cordate cut, Leaves obl. lanceolate serrated smooth

13681 Leaves 3-lobed serrated : lohes oblong serrated, Bractes 3-lobed ciliated, Petioles shorter than peduncle

and Miscellaneous Particutars.
women in childbed, and persons bed-ridden. Sown in pots on heat early in the season, and transplanted as soon as the frosts are over into a mass of light rich soil, the plant makes one of the most magnificent of border annuals, often attaining the height of ten or twelve feet.
2035. Hura. Its American name. H. crepitans is a rapid growing tree. From the quickness of its vegetation, its parts are of so loose a texture, that a loud clap of thunder, or a sudden gust of wind, frequently causes the largest boughs to snap asunder. The wood is only fit for joists and spars: the sap of the leaves and bark is corrosive, and the seeds when roasted purge both upwards and downwards. The species are propagated by large ripened cuttings, planted in sand, plunged in heat, and covered with a hand-glass. Its fruit when ripe bursts with a loud crack, whence the specific name of crepitans; they are of a very elegant form, resembling a depressed sphere with many rounded ribs, arranged with the utmost symmetry.
2036. Sterculia. Sterculius was the god of the privy, from stercus, excrement. It has been well observed by a French author, that the Romans, in the madness of paganism, finished by deifying the most immodest objects and the most disgusting actions. They had the gods Sterculius, Crepitus, Priapus ; and the goddesses Caca, Pertunda, \&c. \&c. The flowers of one species and the leaves of the other are highly fetid. The species are lofty trees with large leaves, and some of them very showy flowers: they all thrive in light loamy soil; and ripened cuttings, with their leaves on, root in sand, plunged in moist heat, and covered with a handglass. The famous Cola nut of Guinea is the produce of S . acuminata,
2037. Hevitiera. Named in honor of Charles Louis L'Heritier de Brutelle, a distinguished French botanist, who was unfortunately assassinated in a street of Paris in 1800 . He published many works, which will always have a high reputation for the excellence of their text, and the magnificence of their illustrations. A fine tree, which may be treated like Sterculia.
2038. Acalypha. A Greek name for the nettle, which this genus much resembles. It is compounded of \(\alpha\), privative, zanos, beautiful, and a \(\alpha \eta\), touch. Plants of no beauty and the easiest culture.
2039. Dalechampia. So called after James Dalechamp, a French botanist, born in 1513, died in 1588. He left a General History of Plants, and some commentaries upon Pliny. May be treated as Plukenetia.

\title{
9040. PLUKENE'TIA. W. Plukenetia. Euphorbiacea. Sp. 1-5
 \\ History, Use, Propagation, Culture,
}
2040. Plukenetix. Named after Leonard Plukenet, an English botanist, who published some valuable worke, with an immense number of copperplates, of singular merit for their time. The names of two of these works are so singular as to deserve explanation. One was called Amaltheum botanicum. This word in Greek, A \(\mu \infty \lambda\) Atio, was the name of the goat which suckled Jupiter. As its milk was exquisite and abundant, the word came to signify, among the ancients, the symbol of richness and abundance. The famous library of Atticus was called Amaltheum, on account of the number and variety of the books which it contained. In

\section*{Class XXII. - DIGECIA.}

\section*{Male and female flowers upon different plants.}

To this class many of the observations made upon the last are cqually applicable. Like it, the genera would have been more conveniently distributed among previous classes. The genera it contains are chiefly trees, and many of them form the most valuable portion of the forests of all parts of the world.

In Monandria is found the celebrated Pandanus or screw pine, which, with its strange spiral branches, constitutes one of the most singular features of the vegetation of the Isle of France. Diandria contains the valuable Salix; Pentandria, the hop, the hemp, and the spinage. The black Bryony, and various palms have a station in Hexandria; the poplar in Octandria; the Papaw and the Bonduc tree in Decandria. Monadelphia is richly endowed with valuable trees, such as the yew, the Norfolk Island pine, the juniper, the nutmeg ; and it also contains the wonderful pitcher-plant of China.

Order 1. MONANDRIA

Stamen 1.
2041. Pandanus. Male. Cal. O. Cor. O. Anthers cuspidate. Female. Cal, O. Cor. O. Style bifid. Drupe compound or simple.

Order 2. DIANDRIA.
 Stamens 2.
2042. Salix. Barren A. Scales of the catkin single-flowered, imbricated, with a nectariferous gland at its base. Perianth. O. Stam, 1-5. Fertile fl. Scales of the catkin single-flowered. Perianth. O. Stigmas 2, often cleft. Caps. 1-celled, 2-valved, many-seeded. Seeds comose.
2043. Cecropia. Male. Spatha falling off. Catkin cylindrical. Cal. turbinate 4-cornered scales, Cor, \(\mathbf{O}\). Female, as in the male. Style 1. Stigma torn. Ovaries imbricated. Berry 1 -seeded.
2044. Borya. Male. Cal, 4-leaved. Cor. O. Stamens 2-3. Female, Stigma capitate. Berry 1 -seeded.

Order 3. TRIANDRIA.

Stamens 3
2045. Empctrum. Barren f. Cal, tripartite. Cor. of 3 petals ( 7 in E. B.). Stam. 3 ( 9 in E. B.), upon long filaments. Fertile fl. Cal. tripartite. Cor. of 3 petals. Style very short. Stigma with 6-9 rays. Berry superior, globose, with 6-9 seeds.
2046. Willi'enovia. Male. Cal, of many glumes. Petals 6 . Nectary fleshy, 6-parted, surrounding the corolla. Female. Ovary superior. Style 1. Stigmas 2-3. Drupe 1-seeded.
2047. Restio. Spike imbricated. Cal. 6 equal glumes. Cor. O. Female. Styles 2-3. Nut stony, 1-celled, 1 -seeded.
2048. Elegia. Cal. 6 unequal glumes. Female. Styles 3. Caps, 6-celled. Seeds solitary.

\section*{and Miscellaneous Particulars}
this sense Plukenet applied it to a work in which a great variety of curious plants was assembled. The other work was called Almagestum. This also came originally from the Greek. Claudius Ptolomæus, an astronomer and mathematician, published about the middle of the second century a work on astronomy, called Suyraछk \(\mu \mu \varepsilon \leqslant \sigma 7 \eta\), which may be Englished "Great work." Ishac ben Honain translated it into Arabic at the beginning of the ninth century, by order of the Caliph Mahmoun; to its title he added the Arabic articie \(A /\), and so formed the word Al-magesti or Almaghesti.
2049. Phenix. Cal. 3-parted. Petals 3. Ovary 1. Drupe ovate-oblong.
2050. Stitago. Male. Cal. tubular, 3-4-toothed. Cor. O. Stamens 2-3. Female, an annular disk at the base of the ovary. Stigmas 2, one bifid. Drupe 1-sceded,
9051. Osyris. Mate. Cal. S-fid. Cor, O. Female. Style 1. Stigma roundish. Berry 1-celled,

Order 4. TETRANDRIA.

2052. Aulax. Male. Flowers racemose. Cal. O. Petals 4, staminiferous, Female Stigma oblique Nut exserted, ventriccse, bearded.
2053. Leucadendron. Male. Flowers capitate. Cal. O. Petals 4, staminiferous. Female. Stigma oblique. Nut or samara 1 -sceded, included in the scales of the cone.
2054. Viscum. Barren f. Cal. O. Petals 4, dilated at the base, connate, resembling a cal. Anthers sessile, adnate with the petals. Fertile f. Cal. subnoarginate. Petals 4, dilated at the base. Style 1. Drupe inferior, 1 -seeded.
2055. Myrica. Barren fl. Scales of the catkin concave. Perianth, O. Fertile fl. Scales of the catkin concave. Perianth. 0 . Styles 2. Drupe 1-celled, 1 -seeded.
2056. Nageia. Cal, 4-leaved. Cor. O. Style bifid. Drupe 1 -seeded.
2057. Shepherdia. Male flowers in a catkin, 8 -androus. Female racemose at the ends of the branches. Limb of calyx flat, regular, 4 -parted. Disk with 8 glands. Fruit of Hippophae.
2058. Hippophae, Male flowers in a catkin, tetrandrous. Female solitary in the axillæ of the leaves. Calyx tubular, bifid at end, closed. Disk \(O\). Fruit formed of a berried calyx and akenium.
2059. Broussonetia. Male. A cylindrical catkin. Cal, 4-parted. Female. A globose catkin. Cal, tubular, 3-4-toothed. Ovaries becoming fleshy, clavate, prominent. Style lateral. Seed 1, covered by the calyx.
2060. Schcefferia. Cal. 4-leaved. Petals 4 or O. Berry 2-celled. Seeds solitary.
2061. Brucea. Male. Cal. 4-parted. Petals 4. Disk 4-lobed. Female. Pericarps 4, 1-seeded.
2062. Anthospermum. Male. Cal. 4-toothed. Cor. with a short tube, and 4-parted limb. Female. Ovary inferior. Styles 2, reflexed. Fruit bipartible.
2063. Trophis. Male. Cal. O. Petals 4. Female. Cal. O. Cor. O. Style 2-parted. Berry 1 seeded.
2064. Montinia. Male. Cal. 4-toothed. Petals 4. Female. Style bifid. Stigmas reniform. Capsule inferior, 2-celled, many-seeded.

Order 5. PENTANDRIA.

Stamens 5
2065, Pistacia. Male. Cal. 5-fid. Cor. O. Female. Cal. 3-fid. Cor. O. Styles 5 . Drupe 1-seeded,
2066. Xanthoxylum. Male. Cal. 5-parted.
Cor. O. Stamens 3-5. Female. Ovaries 5. Caps. 3-5, oneseeded.
2067. Picramnia. Male. Cal. 3-5-parted. Petals 3-5. Stamens 3-5. Female. Styles 2. Berry 2-celled, 2 -seeded.
2068. Antidesma. Male. Cal. 5-leaved. Cor, O. Anthers bifid. Female. Stigmas 5. Berry cylindrical, 1-seeded.
2069. Iresine. Male. Cal. 2-leaved. Petals 5. Scales 5-7. Female. Stigmas 2, sessile. Caps, with downy seeds.
2070. Spinacia. Male. Cal. 5-parted. Cor. O. Female. Styles 4. Seed 1, within the indurated calyx.
2071. Fluggea. Male. Cal. 5-leaved. Cor. O. Rudiment of an ovary. Female. Style 2-parted. Stigmas recurved, bifid. Berry 4 -seeded. Seeds with an arillus.
2072. Acnida. Male. Cal. 5-parted. Cor, O. Female. Cal. 3-parted. Styles O. Stigmas 3, sessile. Caps 1-seeded.
2074. Cannabis. Male. Cal. 5-parted. Female. Cal. 5-leaved, entire, opening at the side. Styles 2. Nut 2-valved within the closed calyx.
2074. Humulus. Barren fl. Perianth. single, of 5 leaves. Anthers with 2 pores at the extremity. Fertile f. Scales of the catkin large, persistent, concave, entire, single-flowered. Perianth. \(\mathbf{O}\). Styles 2. Seed 1.
2075. Modecca. Cal. 5-fid. Petals 5 , inserted in the calyx. Scales 5-10, rarely O. Male. Stamens 5. Anthers erect. Female, Caps, stalked, 1-celled, 3.valved, many-seeded.

\author{
Order 6. HEXANDRIA.
}
2076. Xerotes. Cor. 6-parted, somewhat colored. Male. Stamens 6. Anthers peltate. Female. Stamens abortive. Ovary 3 -celled, with 1 -seeded cells. Caps. cartilaginous, 3-celled, 3-valved. Seeds peltate.
2077. Elais. Cal. 6-leaved. Cor. 6-fid. Style 1. Stigmas 3. Drupe 1-sceded, fibrous. Nut 3-valved.
2078. Chamedorea. Cal. 3-parted. Cor. 3-parted. Stamens 6. Rudiment of a style. Female. Scales 3. Styles 3. Drupe succulent, l-seeded.
9079. Borassus. Cal. 3-leaved. Cor hypocrateriform, with a 3-parted limb. Female. Cal. 8-9-leaved, imp.
bricated. Cor. O. Style O. Drupe with 3 stones.
2080. Mauritia. Cal, cyathiform, somewhat 3-toothed. Petals 3. Drupe 1-seeded, tessellated.
©81. Smilax, Cal. 5-leaved. Cor. O. Styles 3. Berry 3-celled. Seeds 2.
2082. Taus. Cal, 6-parted. Cor. O. Styles 3-fid. Berry 3-celled, inferior. Seeds 2.
2083. Testudinaria. Perianth. 6-parted, spreading: segments linear, nearly equal. Male. Stamens 6, inserted in the base of the segments. Female. Styles 3 , united. Capsule membranous. Seeds winged.
2084. Rajania, Cal, 6-parted. Cor, O. Styles 5. Samaræ 1-seeded.
2085. Dioscorea. Cal. 6-parted. Cor. O. Styles 3. Capsule 3-celled, compressed. Seeds 2, membranous. Leaves generally alternate.
2086. Mab. Cal. 3-fid, Cor, tubular, trifid. Drupe 2-celled, Cells 2-seeded,

Order 7. OCTANDRIA.

Stamens 8.
2087. Populus. Barren fl. Scales of the catkin lacerated. Anthers 8-30, arising from a turbinate, oblique, entire, single perianth. Fertile A. Scales of the catkin lacerated. Perianth. turbinate, entire. Stigmas 4. Caps. superior, 2-celled, 2-valved, many-seeded. Seeds comose.

Order 8. ENNEANDRIA.
Stamens 9.
2088. Mercurialis. Barren f. Perianth. single, tripartite. Siam. 9-12. Anthers globose, 2-lobed. Fertile f. Perianth. single, tripartite. Styles 2. Caps, 2-celted. Cells 1 -seeded.
2089. Hydrocharis. Barren f. Cal. tripartite. Petals 3, "the three interior filaments beaked." Sm. Fertile f. Cal. tripartite. Petals 3. Styles 6, each with 2 stigmas. Caps. inferior, coriaceous, roundish, sixcelled, many-seeded.
2090. Triplaris. Cal. 3.parted. Petals 3. Stamens 9. Styles 3. Capsule 1-seeded, 3-valved.

\section*{Order 9. DECANDRIA.}
 Stamens 10
2091. Coriaria. Cal. 5-parted. Cor. O. Scales 5. Anthers 2-parted. Styles 5. Caps. 5, 1-seeded, covered by the enlarged scales.
2092. Kiggelaria. Cal. 5-parted. Petals 5; glands 5, 3-lobed. Anthers perforated. Styles 5. Capsule onecelled, 5-valved, many-seeded.
2093. Schinus. Cal. 5-fid. Petals 5. Berry 3-coccous,
2094. Gymnocladus. Cal. 5-toothed. Petals 5. Style 1. Legumen 1-celled, pulpy inside
2095. Caria. Male. Cal. hardly any. Cor. 5 -fid, funnel-shaped. Filam. in the tube of the cor. Female. Cal. 5-toothed. Petals 5. Stigmas 5. Berry furrowed, 1-celled, many-seeded.

\section*{Order 10. DODECANDRIA.}
 Stamens 12.
2096. Stratiotes. Male. Spatha 2-leaved. Cal. 3-parted. Petals 3. Stamens 11-13, perfect, 20 abortive. Ovary inferior, 6-angular. Styles 6, 2-parted. Berry 6-celled, many-seeded.
2097. Hyananche. Cal. 5-7-leaved. Cor. O. Stamens 10-20. Style 1. Stigmas 3. Caps. 3-celled, 3-coccous. Cells 2 -seeded.
2098. Euclea. Cal, 5-toothed. Cor. 5-parted. Stamens 15. Ovary superior. Styles 2. Caps. berried, 3 -horned, 3-celled. Seeds solitary, with an arillus.
2099. Datisca. Male. Cal. 5-leaved, Cor. O. Anthers sessile. Female. Cal. 2-toothed. Styles 3. Capsule 3-angular, 3-horned, 1-celled, pervious, inferior.
2100. Menispermum. Male. Cal. 2-leaved. Petals 4 or 6 on the outside, 8 inside. Stamens 16. Female. Stamens 8, sterile. Ovaries 2-3. Berries 2, 1-seeded.
2101. Cocculus. Sepals and petals ternate, usually in two, rarely in three rows. Male. Stamens 6, distinct, opposite the petals. Female. Drupes berried, 1-6, generally oblique, reniform, somewhat compressed, 1 -seeded. Cotyledons distinct.

\section*{Order 11. ICOSANDRIA.}

Stamens numerous, inserted in the calyx.
2102. Flacourtia. Cal, 5-parted. Cor. O. Stamens 50-100. Stigma stellate, sessile. Berry many-celled, with 2 -seeded cells.
2103. Peumus. Male. Cal. campanulate, 5-fid. Petals 5, inserted in the calyx, reflexed. Stamens about 46, glandular. Female. Scales 5, subsagittate. Ovaries 2-9. Style O. Drupes oval, acuminate.
2104. Geionium. Cal. 5-leaved. Cor. O. Stamens 12, Stigmas 3, lacerated. Caps. 3-celled, 3-valved, 3 seeded.
2105. Rottlera. Male. Cal. 2-parted. Cor. O. Stamens 30-40. Female. Cal. 4-toothed. Styles 3. Caps. S-celled, tricoccous, 3 -seeded.

Stamens numerous, inserted under the ovarium.
2106. Cliffortia. Cal. 3-leaved. Cor. O. Stamens about 30. Styles 3. Caps. 3-celled. Seed 1.
2107. Cycas. Male. Catkin imbricated. Cal. a spatulate scale. Cor. O. Anthers globose, sessile, on a scale. Female. Spadix compressed, 2 sided. Cal, O. Cor. O. Style 1. Drupe 1 -seeded.
2108. Zamia. Catkin like a cone. Male. Calyx an obovate scale. Cor. O. Anthers globose, opening by a slit, sessile on the scale. Female. Cal peltate scales. Ovaries 2. Style O. Berries 2, 1-seeded.

Order 13. MONADELPHIA.

\section*{Stamens united into one body.}
2109. Latania. Spadix many-leaved. Calyx 3-leaved. Petals 3. Stamens 15-16. Drupe coated, with three stones.
2110. Leptocurpus. Cal. 6-leaved, glumaceous. Cor. O. Stamens 3. Ovary superior. Style 1. Stigmas 2 or 3. Utricle or nut crustaceous, crowned by the base of the style.
2111. Ruscus. Cal. 6-leaved, Cor, O. Male. Rudiment of ovary ovate, perforated at end. Female. Style 1. Berry 3-celled. Seeds 2.
2112. Araucaria. Male. Catkin imbricated. Cal. a woody scale. Anthers \(10-12\), united in a scale. Female. Catkin cone-shaped. Cal. a lanceolate 2-flowered scale. Style O. Stigma 2-valved. Nut coriaceous, cuneiform, winged at end.
2113. Juniperus. Barren f. Scales of the catkin subpeltate. Perianth. O. Stam. 4-8, 1-celled. Fertile f. Scales of the catkin few, united at length, fleshy, and surrounding the 3-seeded berry.
2114. Taxus. Barren fl. Perianth. single at the base. Stam. numerous. Anthers peltate, 6-8-celled. Cells opening beneath. Fertile fl. Perianth. single, urceolate, scaly. Style O. Drupe fleshy, perforated at the extremity.
2115. Ephedra. Male. A catkin. Cal. 2-fid. Stamens 7. Anthers 4 inferior, 2 superior. Female. Cal, 2-parted, quintuple. Ovaries 2. Seeds 2, covered by the berried calyx.
2116. Cissampelos. Male. Cal. 4-leaved. Cor. O. Disk rotate. Stamens 5. Filaments connate. Female. Cal. 1-leaved, ligulate, roundish. Styles 3. Berry 1 -seeded.
2117. Exceccaria. Male. Catkin cylindrical. Cal. a scale. Filament 3-parted. Female. Calyx 3 scales. Caps. 3-coccous.
2118. Adelia. Male. Cal. 3-parted. Cor. O. Stamens OO. Female. Cal. 5-parted. Styles 3, torn. Capsule 3-coccous.
2119. Loureira. Male. Cal. 5-parted. Cor. tubular, campanulate, 5 -fid. Stamens 8-13, cohering at base. Female. Stigmas 3-4. Capsule dicoccous, 2 -celled, with 1 -seeded cells.
2120. Myristica. Male. Cal. O. Cor. campanulate, trifid. Filament columnar. Anthers 6-10, connate. Female. Style 1. Stigmas 2. Drupe with an arilled 1-seeded nut. Seed large, veiny, variegated in the inside.
2121. Nepenthes. Cal. 4-parted, spreading, colored inside. Cor. O. Filament columnar. Anthers 15-17, connate. Stigma peltate, sessile. Caps. 4-celled, many-seeded.
2122. Cluytia. Male. Cal. 5-leaved. Petals 5. Disk glandular. Stamens 5, inserted into the rudiment of an ovarium. Female. Styles 3. Capsule 3-celled. Seed 1.

\section*{History, Use, Propagation, Culture,}
2041. Pandanus. The Malay name of the genus is Pandang, which is said to signify, being interpreted, something to be regarded, and to have been so named on account of the beauty of the tree, and its exquisite odor. P. odoratissimus is a large spreading branching bush, with stem-clasping imbricated leaves, bearing some resemblance to those of the pine-apple; from three to five feet long, and placed in three spiral rows round the extremities of the branches. It grows in all soils and situations in the warmer parts of Asia, and is much employed there for hedges. It grows readily from branches, whence it is rare to find the full-grown ripe fruit. The tender white leaves of the flowers, chiefly those of the male, yield that most delightful fragrance, for which they are so generally esteemed, and for which the plant is cultivated in Japan. Of all the perfumes, it is by far the richest and most powerful. The lower pulpy part of the drupe is sometimes eaten by the natives in times of scarcity and famine. The tender white base of the leaves is also eaten raw or boiled, at such melancholy times. The taste of the pulpy part of the drupe is very disagreeable. The roots are composen of tough fibres, which basket-makers use to tie their work with; they are so soft and spongy as to serve the natives for corks The leaves are composed of longitudinal, tough, useful fibres. In the South Sea Istands, where the Pandabus is also a native, this or some other species or variety is used for making mats. The leaves are beautifully white and glossy. In the Sandwich islands these mats are handsomely worked in

\section*{MONANDRIA.}

13683 Leaves at back and edges spiny-toothed, Fruit globose solitary
13684 Leaves at back and edges spiny-toothed, Fruit globose, Branches ternate dichotomous
18685 Stem without stolones, Clust. of drupes with from 9 to 20 cells obtuse depressed and tessellate at end
13686 Leaves at back and edges spiny-toothed, Fruit globose aggregated
13687 Leaves quite entire
13688 Leaves at edge and back serrate-spiny, Branches of stem erect
L3689 Leaves and edges spiny-toothed, Spines distant, Drupe oblong solitary, Fruits fascicled

13691 Leaves lanceolate tapering toward each end serrat. smooth Footst. decurr. Catk, accompanying the leaves triandrous, Ovary stalked oblong constricted smooth
13692 Leaves lanceolate tapering at each end serrated glaucous beneath, Catkins accompanying the leaves triandrous polygamous, Ovary stalked oblong lanceolate smooth, Stigmas sessile
13693 Leaves lanceolate pointed obtuse at the base smooth wavy and serrated, Footstalks decurrent, Catkins accompanying the léaves triandrous, Ovary stalked elliptic oblong, Style elongated
13694 Leaves elliptical roundish at the base serrated pointed glaucous white beneath, Catkins accompanying the leaves triandrous, Ovary stalked ovate smooth, Stigmas sessile
13695 Leaves ovate unequal at the base serrated smooth, Catkins accompanying the leaves triandrous, Ovary stalked ovate compressed smooth, Stigmas nearly sessile, Young branches furrowed
13696 Lvs. lanc. serrate quite smooth, Petioles somew. glandular, Ovary narrowed stalked, Branches varnished 18697 Leaves lanceolate acuminate serrated smooth, Ovaries pedicellate subulate smooth
13698 Lvs, lin. pointed finely serrat. smooth, Stam. about G, Ovary stalked round,-ovate smooth, Stigmas sessile
13699 Leaves elliptic-lanceolate pointed finely serrated smooth glaucous beneath, Catkins following the leaves, Stamens about 6 deflexed, Ovary stalked ovate smooth, Style elongated
13700 Leaves ovato-lanc, pointed serrated green on both sides smooth with a downy rib and footst. Catkins accompanying the leaves vill. Stam, about 5 bearded at base, Ovary stalked ov. lanc. smooth, Stigm. divid.
\(13 \% 01\) Leaves elliptic-lanceolate or ovate pointed crenate glandular smooth, Footstalks glandular at the top, Catkins following tne 'eaves, Stam. 5 or more hairy, Ovary ovate smooth nearly sessile
13702 Leaves ellipt. lanc, acute cren. smooth glaucous beneath, Catkins before leaves, Ovary stalked lanc. downy
13703 Leaves elliptical lanceolate with wavy serratures smooth glaucous beneath, Stipules somewhat lunate glandular on the inside, Ovary stalked silky, Style longer than the stigma
13704 Leaves obovate bluntish serrated smooth glaucous bencath, Catkins dense with fringed scales, Ovary staiked awl-shaped nearly smooth, Style longer than the stigmas
13705 Leaves elliptical acute at each end smooth serrat. green on both sides: midrib footstalks as well as young foliage downy, Catkins hefore the leaves, Ovary ovato-lanceolate long stalked smooth
13706 Leaves elliptical acute serrated smooth obtuse at base glaucous beneath : midrib footstalk as well as young foliage hairy, Ovary oblong downy
13707 Leaves elliptical acute tooth-serrated smoothish glaucous beneath, Ovary lanceolate silky
13708 Lvs. ellipt. acute serrat. smoothish glaucous ben. Stip. small or none, Catk. hairy, Caps. sess. very smooth
13709 Leaves oblong elliptical acute serrated smooth glaucous beneath, Footstalks elongated downy, Stipules ovate toothed permanent, Catkins before the leaves, Ovary lanceolate smooth
13710 Lvs. ovate acute serrated undulate crackling smooth heart-shaped at the base glaucous beneath, Stipules unequally heart-shaped longer than the broad footstalks, Catkins very woolly, Ovary lanc. smooth
13711 Lvs, ovate acute serrated smooth glaucous beneath, Footstalks very short smooth, Stipules ovate serrated permanent, Catkins accompanying the leaves, Ovary lanceolate nearly sessile

and Miscellaneous Particulars.
a variety of patterns, and stained of different colors. The branches being of a soft sponyy juicy nature, cattle will eat them very well when cut into small pieces. They call it Wharra tree at Otaheite. (Hawhsw. Voy. ii. 217.)
2042. Salix. From the Celtic sal, near, and lis, water. Our common name osier, seems to be a slight alteration of the Greek osoto, which means the same thing. This is a numerous and difficult genus of trees and shrubs, with one or two exceptions limited in their range to the temperate regions of Europe and America, Many of the species are distinguished by such delicate shades, that only the most acute botanists can recognize them. Soil, situation, and climate produce so considerable a change in their appearance, as to render it difficult to determine what are species and what varieties. Those species which attain a timber size, are chiefly valued for the rapidity of their growth; they produce a great bulk of trunk and lop in a short time, and the bark of most of the species has recently been used in tanning; being, at an average of sorts, about half as valuable as that of the oak. S. alba is considered the most valuable timber tree of the genus; it has a branching stem, and tapering flame-shaped head. It may be seen pollarded by way-sides in mosi parts of Europe, in which state it is very productive of poles, fence wood, crate ware, fuel, and bark for the tamer, which is considered nearly as good as that of the oak. A variety of this species, called by Pontey, the red

13712 Lvs oval-obl. acute with distant wavy serratures smooth glauc. ben. Stipules \(\frac{8}{8}\) heart-shaped deeply toothed, Catkins villous before the leaves, Ovary stalked ovate pointed silky, Style elongated, Stigma cloven 13713 Leaves ovato-lanceolate smooth bluntly serrated glaucous beneath, Catkins before the leaves, Scales short rounded hairy, Ovary awl-shaped silky on a stalk thrice the length of the scale
13714 Lvs. lanc. acute very long gradually tapering at base finely serrated quite smooth scarcely paler beneath, Stip. \(\frac{1}{2}\) heart-shap. Catkins before lvs. erect smooth, Ovary stalk. ov. smooth, Style divid, Stigm. 2-Lobed
13715 Leaves lanceolate serrated smooth glaucous beneath somewhat unequal at base, Stipules lunate toothed, Catkins lax, Ovary stalked ovate silky, Stigmas sessile divided
13716 Lvs. ovato-lanc. bluntly serr, smooth ac. glauc. ben. gland. at base, Stip. ov. with gland. serrat. Catk. wool. Ovary lanceolate smooth its stalk longer than the scale, Style the length of the divided stigmas
13717 Lvs. ovato-lanc. serrat. smooth paler ben. heart-shaped at the base, Stip. rounded finely toothed, Catk, accomp. Ivs. mostly triand. Sca, lanc. Woolly, Ovary stalked lanc, smooth, Style length of divided stigm.
15718 Lvs. ellipt. lanc rigid smooth sharply serrat, two lowest serratures elongated, Footst. hairy, Stip. dilated round. with glandul. serrat. Catk. accomp. Ivs. mostly triand. Sc. woolly, Ovary lanc. smth. on long stalk
137 I9 Lvs, ov taper-point, smooth shining with glandul. serrat. mostly crowded at stip. tooth, Catk. accomp. Ivs, mostly triand, Scales hairy at base obt, serr, and smooth at end, Ovary stalked lanc. awl-shaped smooth, Style divided, Stigma obtuse
13720 Leaves lanceolate pointed smooth green on both sides with gland. serr. Catkins accomp. lvs. Nect. double rather large: its lobes lanceolate smooth toothed at the summit; the terminal flowers triandrous
13721 Lvs, lanc, acum, uneq, and bluntly serrated smooth somew. glauc. ben. Branches dark purple with a bloom
13722 Leaves lanc, acute with cartilaginous serrat. smooth above glaucous and somew. silky ben. Stip. small and deciduous smooth on their inside. Ovary sessile ovato-lanceolate smooth, Stigmas neariy sessile 2-lobed
13723 Leaves ovato-lanc. pointed serrated throughout very smooth, Footstalks glandular, Ovary ovate nearly sessile, Male flowers with an abortive ovary
13724 Leaves broadly lanc. pointed smooth with glandular serrat. glaucous beneath, Footstalks slightly hairy without glands, Catkins before the leaves, Ovary sessile ovate smooth, Style elongated
13725 Triandrous, Stamens reflexed, Leaves about four inches long and one broad smooth and green beneath
13726 Leaves lanceolate taper-pointed sharply serrated smocth glaucous beneath, Stipules \(\frac{3}{2}\) ovate taper-pointed revolute, Catkins naked accompanying the leaves, Ovary ovate sessile smooth, Branches pendulous
13727 Decumb. Stam. 1, Leaves obovato-lanc. serrated smooth narrow at base, Stigm. very short ov. nearly sess.
13728 Lvs. downy serrulate acum. glaucous beneath, when old becoming smoother, Catkins before lvs. Style long 13729 Erect, Stamen 1, Leaves mostly opposite oblong lanc. pointed slightly serrated smooth linear at base, Style nearly as long as divided stigmas
13730 Erect, Stam. 1, Lvs. obov. lanc. ac. serrat. smth. round. at base, Stip. none, Stig. very short ov. notched obt. 13731 Branches downy, Leaves elliptical acute glaucous beneath: the young ones downy
13732 Stam. combined below, Leaves linear lanc. elongated acute smooth with shallow serrat. green on both sides
13733 Erect, Stamen 1, Leaves alternate with small stipules lanceolate acute with shallow serratures smooth rounded at base glaucous beneath, Style nearly as long as the linear divided stigmas
13734 Stamens combined below, Leaves elliptical slightly serrated quite smooth glaucous beneath
13735 Leaves elliptic-oblong toothed waved thin and crackling very smooth, Stipules heart-shaped about the length of the footstalk, Catkins very woolly, Ovary lanceolate smooth on a short stalk
13736 Leaves linear lanceolate acute very finely serrated smooth shining and green on both sides, Stipules none, Catkins accompanying leaves cylindrical villous, Scales ovate acute, Stam. 3 to 5 bearded half way up
13737 Leaves very long linear-lanc. closely serrated tapering gradually and somewhat falcate upwards acute at the base smooth on both sides; the young ones silky, Stipules crescent-shaped toothed deflexed
13738 Leaves elliptical nearly orbicular smooth somewhat serrated in the middle rather glauc. beneath, Catk after the leaves, Capsules ovato-lanceolate stalked downy
13739 Leaves ovate serrated naked smooth and even above glaucous beneath, Branches rather downy, Capsules ovate silky, Style as long as the stigmas
13740 Leaves elliptical serrated smooth veiny polished on both sides, Young branches hairy, Ovary awl-shaped clothed with silky hairs, Style as long as the cloven stigmas
13741 Leaves obovate-elliptical smooth rather acute serrated in the middle shining above somewhat glaucous beneath, Ovary lanceolate silky, Young branches smooth
13742 Lvs. ov. serrat. nak. reticul. with promin. veins above rather glauc. ben. Ovary ellipt. silky, Style very short 13743 Somew, erect straggling, Branches polished, Lvs. obl. lanc. acute at each end serrul. in midd. very smooth 13744 Leaves obovate lanceolate acute smooth subserrated glaucous beneath, Stipules small, Ovaries ovate silky 13745 Leaves ovate serrated smooth even above glaucous and silky beneath, Ovary ovate silky, Style as long as the stigmas, Stems decumbent
13746 Leaves ovate finely toothed smooth minutely veined folded so as to form a keel, Ovary ovate downy 13747 Lvs. ov. ellipt. ac. serrat. smooth tapering at base glauc, ben. : lower serrat. glandular, Caps. ov. lanc. smth. 13748 Leaves oblong acute serrulate whole colored beneath, when old guite smouth

and Miscellaneous Partioulars.
a century in Scania. Few of the willow species can be considered ornamental, though the male plants of \(S\). pentandra and amygdalina produce numerous showy catkins of a bright yellow color, and very odoriferous. The leaves of S pentandra are also fragrant, exuding a copious yellow resin from their serrated edges. The down of the seeds of this and other species, mixed with the third part of cotton, has been found a useful adulteration, especially for stuffing cushions and forming candle-wicks. Goldfnches and other birds line their nests with this material.

The weeping-willow is generally admired ; it grows wild on the coast of Persia, and is common in China. It is sometimes said to have been introduced by Pope, but the celebrated specimen of that tree which stood in

13766 istory，Use，Propagation，Cuiture，
the poet＇s garden at Twickenham，was a cutting from some rods employed in a package which came from Spain．Pope being present when the package was opened，observed that the pieces of stick appeared as if they had some vegetation，and added，perhaps they may produce something which we have not in England．Under this idea he planted it in his garden，and it produced the willow tree that has given birth to so many others； not as the parent tree of all the willows in the country，but as an admired and celebrated specimen．S．herbacea is not properly an herbaceous plant，but possesses the Linnean character of a tree，and is the smallest yet

13749 Lvs, lanc. acut. serrul. smooth glauc. ben. Catkins appearing with lvs. Caps, ov. lanc. smooth, Styles twin
13750 Lvs. obl. lanc, acute crenul.-serr. glaucous beneath, Stipules obsolete, Scales short round with long hairs
13751 Lvs. orbicul. somew. retuse serrated shining on each side, Fem, catkins about 5 -fl. Caps. ov. lanc. smooth
13752 Lvs, obl. and ovate acute toothletted glaucous beneath, Stipules large toothed, Catkins short, Styles long
13753 Leaves lanc, acute obscurely serrated smooth and shining on both sides reticulated with veins beneath,
Ovary lanceolate hairy, Style elongated, Stigmas deeply divided
8. Leaves smooth entire.
[lanceolate smooth ovary
13754 Leaves obovato-lanc. ent. emarg. mmooth shining above, Catk. cylind. many-f. Scales shorter than ovato13755 Leaves obovate entire smooth shining above, Fem. catk. obl. of few-fl. Scales length of obl. smooth ovary 13756 Lvs. ov. or ovato-lanc. acute ent. smooth shin. above, Catk obl. of few-fls. Caps. ellipt. smooth, Stigm. sess. 13757 Leaves orbicular somewhat ellipt, obt. entire coriaceous smooth with reticulated veins glaucous beneath, Stigmas nearly sessile, Capsule shaggy
13758 Lvs. ovate entire bluntish smooth glaucous beneath, Ovary ovato-lanc. smooth its stalk longer than scale
13759 Leaves obov, lanc. acute entire glandular at edge smooth glaucous ben.: young ones silky, Stipules none
13760 Stem depressed, Leaves spatulate obovate obtuse entire smooth shining above gland. at margin beneath, Stip. none, Catk. lax, Scales obl. fringed, Ovary stalked ovate smooth, Style deeply divid. Stigm, 2 -lobed,
13761 Stem depressed, Leaves oval rather acute entire reticulated with veins heart-shaped at the base smooth above pale with a hairy rib and margin beneath, Stipules \(\frac{1}{8}\) heart-shaped
13762 Stem erect, Branches smooth, Lvs. obov, lanc, acute entire smooth, Stip. none, Catk. stalked very smooth, Scales oblong scarcely hairy, Ovary ovate obl. smooth its stalk twice as long as scale, Stigm. sess. divided

\section*{6. Leaves villous.}
[ovate woolly
13763 Leaves nearly entire ellipt.-lanc. even and nearly smooth above woolly ben. Footst, decurrent, Ovary sess.
13764 Leaves oblong lanceolate entire obtuse silky on each side, Caps, ovate oblong villous sessile
13765 Leaves roundish ovate acute entire shaggy on both sides hoary beneath, Capsules sessile smooth, Style four times as long as the blunt divided stigmas
13766 Leaves lanceolate entire bluntish clothed on both sides with long silky harrs, Ovary sessile very woolly, Style about the length of the deeply separated cloven blunt stigmas
13767 Leaves nearly entire ovate acute reticulated and somew. downy above veiny and densely woolly beneath, Ovary sessile very woolly, Style about the length of the deeply separated linear divided stigmas
13768 Stem erect, Lower leaves entire: upper more or less serrated obovate lanc. reticulated with veins glaucous and downy ben. Stip. half heart-shaped serr. Ovary lanc. stalked silky, Style as long as blunt stigmas
13769 Leaves ovate acute serrulate smooth above hairy beneath, Stipules minute, Catkins long
13770 Leaves elliptical acute waved and slightly serrated nearly smooth glaucous beneath, Footstalks dilated at the base, Catkins before the leaves, Ovary stalked lanceolate silky
13771 Leaves lanceolate sharpish nearly entire downy revolute veiny and rugose beneath, Stipules anc. decid. Scales of the catk. oblong fringed, Ovary ovato-lanceolate silky stalked, Style short, Stigmas divided
13772 Leaves elliptical entire tapering at each end polished: the veins beneath as well as the margin hairy, Ovary elliptical downy, Style elongated
13773 Leaves entire elliptical somewhat revolute with a recurved point rather downy above silky and shining beneath as well as the branches, Ovary stalked ovato-lanceolate silky, Style shorter than the stigmas
13774 Leaves elliptical entire recurved acute above downy beneath silky, Ovary ovate lanceolate villous
13775 Leaves brown above downy with short hairs hoary beneath acute nearly entire
13776 Leaves obtuse brown smooth and opaque above silky beneath [ovate downy, Stem depressed
13777 Lvs, ellipt.-lanc. straight somew. point. nearly ent. almost naked above glauc. and silky ben. Ovary stalked
13778 Leaves elliptic-obl, acute straight flat with a few glandular teeth glaucous and silky beneath, Footstalks slender, Stem erect much branched, Stipules none
13779 Leaves elliptical acute convex rarely toothed glaucous rugged and silky beneath, Stem prost. Branches elongated straight, Ovary stalked ovate silky, Style shorter than the stigm.
15780 Leaves elliptical acute finely downy on both sides glaucous beneath slightly serrated towards the point, Stipules very small, Catkins rather before the leaves ovate hairy
13781 Leaves elliptical entire acute at each end reticulated with veins glaucous beneath most hairy at margin, Ovary somewhat stalked ovato-lanceolate villous, Style the length of the deeply divided stigm.
13782 Leaves elliptical heart-shaped pointed finely notehed downy on both sides, Stipules half heart-shaped flat-toothed nearly smooth, Branches hairy
13783 Leaves elliptical acute slightly-toothed smooth, Young branches very smooth, Catkins ovate short erect, Ovary stalked ovate silky, Stigmas ovate obtuse nearly sessile
13784 Lvs. ellipt. nearly ent. with recurv. points glaucous and silky ben. Stem decumbent, Stipules ovate entire
13785 Lvs. ellipt.-obl. somew. serrat. with recurv. points glauc. and silky ben. Stem ascend. Stipules ovate serrated
13786 Leaves lanc. pointed straight somewhat elliptical entire convex smooth above glaucous and silky beneath, Catkins oval erect, Ovary stalked lanceolate, Style the length of the stigma
13787 Leaves linear-lanceolate pointed straight entire silky beneath, Stem erect, Stipules upright flat, Catkins recurved, Ovary stalked lanceolate silky

and Misceilaneous Purceutars.
known; being only from one to three inches in height. S. retusa is nearly as little as \(\mathbf{S}\). herbacea. S. vitellina with its brilliant yellow bark, planted in shrubberies, contrasts well with evergreens and the purple twigged dogwood.

Almost all the willows are of the easiest propagation and culture. Plantations for basket-work or hoops should be made on deep loamy soil on the banks of rivers, within reach of water, but by no means saturated with it. Few willows are either bog or marsh plants. The cultivated species require as much attention as

History，Use，Propagation，Culture，
young trees in a nursery，otherwise they will soon become stunted and of irregular growth．Excellent directions for their culture may be found in Sang＇s Planter＇s Kalendar．
 tree has the trunk and branches hollow every where，and sloped from space to space with membranaceous septas，and answering to so many annual marks in the surface．The leaves are large，peltate，lohed like those of Carica Papaya，and placed at the ends of the branches．The fruits rise four，five or more，from the very top of a common peduncle，and shoot into so many oblong cylindrical berries，composed of a row of little acini， something like our raspberry，which they resemble in flavor when ripe，and are agreeable to most European palates on that account．The wood of this tree，when dry，is very apt to take fire by attrition．The native Indians have taken the hint，and always kindle their fires in the woods by rubbing a piece of it against some

13788 Leaves linear-lanceolate with small glandular teeth entire at the base clothed with close-pressed hairs above downy and rugged with veins beneath, Ovary ovate smooth
15789 Leaves linear very narrow without stipules nearly entire ovate at the base hoary above silky beneath
13790 Leaves lanceolate pointed serr. smooth above glauc. and silky beneath, Stipules linear deflex. deciduous, Catk. before the leaves, Scales hairy, Ovary stalked oblong silky, Stigm. nearly sessile
13791 Leaves lanceolate-obovate with a recurved point serrated at the end clothed with depressed hairs above rugged veiny and downy beneath, Stipules lanceolate
15792 Leaves obovate lanceolate obtuse mucronate with a hooked point subserrate green above hoary beneath
13793 Leaves obovate with a recurved point with wavy serrat. at end green and downy above hoary and shaggy with rugged veins beneath, Stip. \(\frac{1}{2}\) heart-shaped toothed, Caps. lanceolate stalked, Stigm. nearly sessile 13794 Lvs. slightly serrat. obov.-ellipt, downy flat rather glauc. ben. Stipules rounded tooth. Stigm. nearly sess.
13795 Lys. obov. lanc. flat rather rigid minute, indent. ac. undern. glauc, and hairy, Stip. small notch. Catk. ellipt.
13796 Lvs. ellipt. almost circular slightly tooth. downy with rectang. veins ben. Style as long as notched stigmas
13797 Leaves entire elliptical acute even downy on both sides somewhat withered at the point, Stipules obsol. Ovary lanceolate silky on a long hairy stalk, Stigmas nearly sessile
13798 Leaves ovate pointed serrated waved downy beneath, Stipules somewhat crescent-shaped, Ovary ovate downy on a long hairy stalk, Stigmas undivided nearly sessile
13799 Leaves nearly entire lanceolate acute shaggy above densely silky beneath, Stigmas capillary deeply divided, Style as long as the ovary
13800 Leaves lanc. oblong pointed waved slightly downy beneath, Stipules kidney-shaped, Ovary ovate silky, Style the length of the linear stigmas
13801 Leaves oblong lanceolate acute distantly serrated smooth above flat and downy beneath, Stipules lunate somewhat toothed, Ovary stalked lanceolate silky, Style elongated, Stigm. deeply cloven
13802 Leaves linear inclining to lanceolate very long pointed entire somewhat wavy silky beneath, Branches straight and slender, Ovary sessile, Style as long as the undivided linear stigmas
13803 Leaves lanceolate pointed obsoletely crenate whitish and silky beneath, Stipules crescent-shaped minute, Stigmas linear deeply divided about the length of the style
13804 Leaves lanc, pointed obscurely crenate downy beneath, Stipules half heart-shaped very large, Nectary cylindrical, Stigmas linear undivided longer than the style
13805 Leaves linear lanceolate pointed revol. obscurely toothed downy above snow-white and cottony beneath, Stip. lanc. about the length of the footstalk, Scales of the catk. with hairs as long as the stamens
13806 Lvs. obl. lanc. ac. at each end nearly ent. without stipul. smooth. above downy ben, Ovary ovate lanc. silky 13807 Leaves elliptic-lanceolate acute serrated permanently silky on both sides: the lowest serratures glandular, Stamens hairy, Stigmas deeply cloven
13808 Lvs. lanc, taper-point, serrat. : under-side at length almost naked; lowest serrat.gland. Stigm. deeply cloven 13809 Leaves obovate serrated flat even silky on both sides, Stipules hairy, Branches minutely downy, Ovary stalked awl-shaped silky, Style as long as the undivided stigmas
13810 Leaves elliptic obl. acute finely notched slightly downy paler beneath, Stipulas half-ovate nearly smooth, Branches minutely downy, Ovary stalked smooth, Style as long as the cloven stigmas
13811 Leaves elliptical obovate acute notched slightly downy glaucous beneath, Stipules vaulted, Branches minutely downy, Ovary stalked silky, Style longer than the thick undivided stigmas
13812 Lvs. obl, acute entire silky on each side hoary ben. Ovaries long-pointed lax, Scales very blunt smooth
13813 Livs. lanc. acum, toothl. at end smooth above rugose and soft beneath, Caps. downy lanc. Stigmas sessile
13814 Leaves 9 -lobed : lobes oblong bluntish hispid and rough above white and downy beneath
18815 Leaves oblong lanceolate obtuse sessile coriaceous revolute at edge dotted beneath
13816 Leaves ovate-lanceolate acute subsessile somewhat membranous
13817 Leaves ovate-Janceolate narrowed at each end stalked membranous serrulated
13818 Leaves 23 inches long 1 broad serrated
13819 Leaves acute serrulate very smooth shining opposite and alternate
13820 Leaves alternate tapered into a short stalk retuse emarginate mucronulate very smooth glaucous
TRIANDRIA.
13821 Frect, Branches downy, Leaves linear revolute at edge roughish above 13822 Procumbent, Leaves linear oblong

harder wood. The bark is strong and fibrous, and is frequently used for all sorts of cordage. The trunk is very light, and for that reason much used for bark-logs and fishing-foats. The smaller branches, when cleaned of the septums, serve for wind instruments. Both trunk and branches yield a great quantity of fixed salt, which is much used among the French, to despumate and granulate their sugars. The fruit is much fed upon by pigeons and other birds, and thus the tree is much spread and propagated. (Browne.) It may be increased like Brosimum.
2044. Borya. Named in honor of M. Bory de St. Vincent, a distinguished French traveller and naturalist, known out of the scientific world by the violence of his liberal opinions. Small bushes of North America, of little beauty. Sir James Smith has altered the name to Bigelovia.
2045. Empetrum. So called from the places of its natural growth, \(E y\), in , and \(\pi \varepsilon \tau \rho \circ 5\), a stone. E. nigrum is

History，Use，Propagation，Culture，
very common in the northern parts of Europe，in elevated situations，on dry，barren，moorish，or boggy soils． It is more patient of cold than even the common heath．The Highlanders＇children eat the berries，but they are no very desirable fruit；and taken in large quantities，are said to bring on a slight head－ache．The Russian peasants，however，eat them，and the Kamtschadales gather great quantities of them to boil with their fish，or to make a sort of pudding with the bulbs of their lillies．They are esteemed antiscorbutic and diuretic． Grouse and heathcocks feed upon them，and they give the excrement a tinge of purple．Boiled in alum－ water they afford a dark purple dye；and boiled with fat，they are said to be used in dying otter and sable skins black．Cattle do not seem to browse on this shrub．The French word Camarine，is an alteration of Cama－ rinhas，the Portuguese name of E．album．

2046．Willdenovia．A rush－like plant，with long flexible slender shoots，named in honor of Charles Louis Willdenow，a celebrated Prussian botanist，whose edition of Linnæus＇s Species Plantarum is not only the best which has been published in modern days，but excellent in itself．
2047．Restio．From restis，cord；the supple shoots of many species are used as withs at the Cape of Good Hope．The houses of the Cape of Good Hope are commonly thatched with this plant both in town and country，and sometimes whole huts are built with it．A roof thatched with it will last twenty or thirty years， and would last much longer，if the south－east wind did not blow much dirt into it，which causes it to rot．
2048．Elegia．From \(\varepsilon \lambda \varepsilon \gamma \circ \rho\) ，lamentation，in allusion to the sad or mourning color of the whole plant．A hard rushy plant，with the babit of a Restio．
2049．Phoenix．The Greek name of the date，and probably so called from Phœenicia，whence the best dates were brought．Dactylifera is the Greek version of Palma，both signifying the hand，to the fingers of which the ancients likened the bunches of dates．P．dactylifera is a lofty palm，with a rugged trunk，on account of the persisting vestiges of the decayed leaves．These leaves，when the tree is grown to a size for bearing fruit，are six or eight feet long，with pinnæ three feet long，and a little more than an inch broad．The flowers of both sexes come out in very long bunches from the trunk between the leaves，and are covered with a spatha，which opens and withers；those of the male have six short stamina，with narrow four－cornered anthers filled with farina．The female flowers have no stamina，but have a roundish germ，which afterwards becomes an oval berry，with a thick pulp enclosing a hard oblong stone，with a deep furrow running longitudi－ nally．The fruit of this tree makes a great part of the diet of the inhabitants of Arabia and part of Persia． In Upper Egypt many families subsist almost entirely upon it．They make a conserve of it with sugar ；and even grind the hard stones in their hand－mills for their camels．In Barbary they turn handsome beads for paternosters of these stones．The date is said to strengthen the stomach and intestines，to stop looseness，and promote expectoration，for which purpose it is given in pectoral decoctions．It is also recommended in the piles，given in red wine．From the leaves of the tree they make baskets or bags in Barbary．In Egypt they make fy－flaps of them，and brushes to clean their sofas or clothes．The hard boughs are used as fences to their gardens，and cages to carry their fowls to markct．The trunk is split for the same purposes，and is even used in small buildings．It serves likewise for firing．The threads of the web－like integument between the

13888 Leaves filiform channelled
158:39 Leaves flat spatulate-linear

and Miscellancous Particulars.
boughs make ropes and the rigging of smaller vessels. The juice of the date tree is procured by cutting off the head or crown of the more vigorous plant, and scooping the top of the trunk into the shape of a basin; where the sap in ascending lodges itself, at the rate of three or four quarts a day, during the first week or fortnight; after which, the quantity daily diminishes, and at the end of six weeks or two months the tree becomes dry, and serves for timber or firewood. This liquor, which has a more luscious sweetness than honey, is of the consistence of a thin syrup, but quickly becomes tart and ropy, acquiring an intoxicating quality, and giving upon distillation an agreeable spirit or araky, which is the general name in the East for all hot liquors extracted by the alembick.
\(\mathbf{P}\). farinifera produces black drupes of the size of a large kidney bean; these the natives of Coromandel eat as gathered from the bush without any preparation. The leaflets are wrought into mats; the common petioles are split into three or four, and used for making ordinary baskets of various kinds; but they are not so proper for this purpose as the bamboo. The small trunk, when divested of its leaves, and the strong brown fibrous web that surrounds the trunk at their insertions, is generally fifteen or eighteen inches long, and six in diameter at the thickest part; its exterior or woody part consists of white fibres matted together, which envelope a large quantity of farinaceous substance, used as food by the natives in times of scarcity; but to separate this from the fibres, the trunk is split into six or eight pieces, then dried, beaten in wooden mortars, and afterwards sifted: the rest of the preparation consists in boiling the meal into a thick gruel, or, as it is called in India, congee. It seems to be much less nutritive than sago, and is less palatable.
2050. Stilago. Perhaps so called from the length of the style; but the name is unexplained by its author. S. diandra produces an eatable fruit used by the natives, but not esteemed by Europeans. The species thrive in sandy loam, and cuttings root in sand under a hand-glass.
2051. Osyris. The Greek name of a tree with long supple branches, which were used for brushes and similar purposes. The modern shrub has also slender flexible branches, of which packing materials are formed throughout the south of Europe
2052. Aulax. From \(\alpha v \lambda \alpha \xi\), a furrow ; in allusion, we presume, to the furrows on the under-side of the leaves of the original species. Neat shrubs with narrow leaves; nearly allied to Protea. This, Sweet observes, is "a pretty genus belonging to the Proteacea, which thrives best in a very sandy loam, with agreat many potsherds broken small at the bottom of the pot, to let the water drain off freely, as they frequently get too much water, which makes the mould sodden, and stagnates their growth. Ripened cuttings, taken off at a joint, and planted in a pot of sand, will strike root, if placed under a hand-glass in the propagating house, and the glass to be occasionally left off, an hour or two at a time, to give them air, and keep them from damping; which should be done in a morning before the sun has much power, or it will make them flag and injure them. Plants are readily raised from seeds, which should be sown in a mixture of two-thirds loam and one-third sand: as soon as they come up, they should be planted off in small pots, in the same kind of soil, as they are very apt to die, if left too long in the seed-pot." (Bot. Cult, 143.)

History, Use, Propagation, Culture,
2053. Leucadendron. From \(\lambda_{\epsilon}\) zoos, white, and \(\delta \varepsilon v \delta \rho o v\), a tree, in allusion to the appearance of the most common species, No. 13,840. The species are evergreen shrubs, with handsome foliage; they grow in light soil well drained and not over watered, and are increased by ripened cuttings in sand under a hand-glass.
2054. Viscum. From the Latin viscus, clammy, on account of the stick nature of the berries. Gui, Fr., Mistl, Ger., and Visco, Ital. This may be considered the only true parasitical plant indigenous to Britain, as at no period of its existence does it derive any nourishment from the soil like Orobanche, or from decayed bark or wood like certain Fungi, and other epiphytes. The root of the misletoe insinuates its fibres into the woody substance of the tree; the shoots are dichotomous, round, smooth, and even; and of a pale green, like the leaves, which are tongue-shaped and entire. The whole forms a pendant bush of from two to five feet in diameter, evergreen, and in winter covered with small white very glutinous berries. The British species of misletoe is commonly found on fruit trees; but it will grow on various others, as the thorn, oak, mapie, poplar, lime, ash, \&c. ; and in the neighbourhood of Magdebourg it is abundant on Pinus sylvestris. It is not difficult to propagate by inserting the berries in slits in the bark early in spring, and tying a shred of mat over the slit to protect them from the birds. The Druids sent round their attendant youths with branches of the misletoe to announce the entrance of the new year; and something like the same custom is still continued in France. In England branches of it are hung up in most houses at Christmas, along with other evergreens. The berries are devoured by several birds of the thrush kind, and especially by the Misletoe Thrush. Birdlime is made from the berries, and also from the bark, boiled in water, beaten in a mortar and washed. It is, however, more commonly manufactured from the bark of the holly.
2055. Myrica. The Greek (evevzn) synonym of the Tamarix. It is said to have been derived from \(\mu \nu \rho a\), to flow, because the plants are always found on the banks of rivers, and in inundated spots. M. Gale has leaves of a bitter taste, but fragrant like those of the myrtle. Their essential oil rises in distillation. The northern nations formerly used this plant instead of hops, and it is still in use for that purpose in some of the western isles, and a few places in the Highlands of Scotland. Unless it be boiled a long time, it is reported to occasion head-ache. The catkins or cones boiled in water throw up a scum resembling bees' wax, which gathered in sufficient quantities would make candles. It is used to tan calf-skins. Gathered in the autumn it dyes wool

13840 Arborescent, Leaves lanceolate silky, Branches villous, Bractes short downy, Cal. silky
13841 Shrubby, Leaves linear lanceolate oblique smoothish, Male cal. smooth: female feathery, Fruit villous 13842 Lvs. lanc. lin. smooth rounded at base, Branches vill. Scales of cone silky cuneate, Fruit comose mucronate 13843 Leaves oval lanceolate : when old smooth, Scales of cone dilated-cuneate silky
13844 Leaves spatulate callous at end, and branches villous, Fruit comose pointless
13845 Leaves linear spatulate tapering at base and branches smooth, Male head sessile larger than leaves
13846 Leaves linear lanceolate smooth : the younger straight tapering at base, Female head shorter than leaves
13847 Leaves linear bluntish twisted smooth, Branchlets somewhat silky, Cal. silky, Fruit comose pointless 13848 Leaves spatulate linear silky with a callous beard at end, Cal. very shaggy, Fruit cuneate downy 13849 Lvs. lin. acute channelled imbricated erect smooth, Scales of cone acute recurved, Fruit obcord, ciliated 13850 Lvs. obl. veiny callous at end recurved smoothish : floral colored \(\frac{1}{2}\) scarious, Scales of cone downy outside 13851 Leaves spatulate obl. callous at end smooth, Branches downy, Scales of cone retuse ciliated downy at base 13852 Lvs. lanc. obl. callous at end smooth : floral colored, Branches somewhat downy, Scales ovate obt. smooth 13853 Lvs, spatul. lanc. call. at end subdecurrent concave and branches smooth, Scalos of cone roundish smoothish 13854 Lvs. lin. lanc. mucron. finally smooth, Invol. ov. ac. longer than head, Scales of cone round. dilated smooth 13855 Lvs. lin, acute with transparent edges and branches quite smooth : floral lin. lanc. long, Fr. winged emargin. 13856 Leaves linear lanceolate acute : floral lanceolate colored concave, Shrub low with ascending branches 13857 Lvs, obl. lanceolate bluntish veinless and branches quite smooth: floral \(\frac{1}{2}\)-colored, Fruit winged emarginate 13858 Leaves linear lanceolate cuspidate somewhat silky : floral lanceolate colored, Fruit very narrow winged 13859 Leaves lanc. lin. silky with down on each side with callous points at end, Branches downy, Calyx hairy 13860 Lvs. lanc. lin. silky with down on each side with call. points at end, Branches shag. Cal, of male hairy in lines 13861 Upp. Ivs. lanc. spatul. ac. rugose, Cones ov. Scales cohering at base distinct above with recurv. beardl. edges 13862 Lvs, all filiform chann. bluntish smooth spreading incurved, Scales cohering at base distinct above 2lobed 13863 Lvs. all filiform channelled acute imbric. straightish ciliated, Scales cohering at base distinct above 2-lobed

13864 Leaves lanceolate obtuse, Stem dichotomous, Heads of flowers axillary

13865 Leaves lanceolate broader upwards serrated, Stem shrubby
13866 Leaves oblong narrowed at base subserrate at end, Scales of male catkins acute, Berries globoge
13867 Leaves oblong narrowed at base coarsely serrated, Scales of male catkins acute, Berries globose
13868 Leaves oblong acute at each end entire or slightly serrated at end revolute at edge
13869 Leaves elliptical lanceolate subserrate, Male catkins compound, Drupe with a 4 celled nucleus
13870 Leaves elliptical toothed: the lowest quite entire
13871 Leaves lanceolate unequally acuminate serrated, Catkins long lax
13872 Leaves oblong deeply sinuated smooth
13873 Leaves oblong oppositely sinuated hairy
13874 Leaves subcordate serrate sessile
13875 Leaves oblong lanc, cuneate tapered at base nearly entire smooth shining with the middle nerve downy 13876 Leaves lanceolate entire netted with veins, Catkins few-flowered lax

and Miscellaneous Particulars.
yellow, and is used for that purpose both in Sweden and Wales. The Swedes sometimes use a strong decoction of it to kill bugs and lice, and to cure the itch. The Welsh lay branches of it upon and under their bedis to keep off fleas and moths, and give it as a vermifuge in powder and infusion, applying it also externally to the abdomen. In most of the Hebrides, as well as in the Highlands of Scotland, an infusion of the leaves is frequently given to children to destroy the worms. In Isla and Jura the inhabitants garnish their dishes with it, and lay it between their linen and other garments to give them a fine scent, and to drive away moths. When it grows within reach of a port, the sailors make besoms of it for sweeping their ships. In the isle of Ely they make faggots with it to heat their ovens. Linnæus was induced to suspect, from the smell of this shrub, that camphor might possibly be prepared from it. Horses and goats eat ; sheep and cows refuse it.
M. cerifera may be used for most of the purposes of the former species. Candles are made from the berries in North America, whence it is called there the tallow shrub or candleberry tree; some also name it the bayberry-bush. It grows abundantly on a wet soil, and seems to thrive particularly well in the neighbourhood of the sea, nor does it seem ever to be found high up in the country. The berries intended for making candles are gathered late in autumn, and are thrown into a pot of boiling water; their fat melts out, floats at the top of the water, and may be skimmed off. The fat when congealed looks like tallow or wax, but has a dirty green color; it is therefore melted again and refined, by which means it acquires a fine and pretty transparent green color. It is dearer than common tallow, but cheaper than wax. They usually mix some tallow with it. Candles of this kind do not easily bend or melt in summer as common candles do; they burn better and slower, nor do they cause any smoke, but rather yield an agreeable smell when they are extinguished. At present not many candles of this kind are used, the animal tallow is readily come at, it being very troublesome to gather the berries. They are chiefly used by poor people, who live near where the bushes grow, and have not cattle enough to supply them. A soap is made from the fat which has an agreeable scent, and is excellent for shaving; and it is used by surgeons for plasters. In Carolina they likewise make sealing-wax from these berries. The root is accounted a specific in the tooth-ache.
All the species grow well in peat soil or sandy loam, in a moist situation. They are increased by seeds or layers, but not readily by cuttings.

History，Use，Propagation，Culture，
2056．Nageia．Nagi is the Japanese name of one of the species．That in the gardens is an uninteresting shrub with a loose elegant foliage，and a light grey bark．Ripened cuttings strike freely in a bark pit．

2057．Shepherdia．A name given by Nuttall to the Hippophae canadensis of our gardens，in honor of Mr． William Shepherd，the worthy curator of the Liverpool botanic garden．A small inelegant tree，with dark green deciduous leaves，covered over with brownish silvery scales on the lower side．

2058．Hippophae．An ancient name given to some plant now unknown，which was applied medicinally to horses；from intros，a horse，and \(\varphi a \sim\) ，to give light．H．rhamnoides is very prolific in berries，which are yellow when ripe，succulent，smooth，and gratefully acid to the taste．They are much eaten by the Tartars；and the fishermen of the Gulph of Bothnia prepare a rob from them，which imparts a grateful flavor to fresh fish． Every part of the plant will dye yellow．The species grow in common soil，and are readily increased by layers or cuttings of the roots．

2059．Broussonetia．Named by L＇Heritier，in honor of his countryman P．N．V．Broussonet，a weh known naturalist，who travelled in Barbary，and published an Ichthyologia in 1782．This is a vigorous growing shrub or low tree，with large lobed leaves，variously shaped；the foliage of the male and female plant differing so much from each other that they might easily be taken for distinct species．The fruit is little larger than peas， and from the bark the Chinese make paper，and the Otaheitans cloth．

B．papyrifera，though a low tree，produces vigorous shoots，furnished with large leaves．The fruit is little larger than peas，surrounded with long purple hairs，when ripe changing to a black purple color，and full of sweet juice．In China and Japan it is cultivated as we do osiers，for the sake of the young shoots，from the bark of which the inhabitants of the east countries make paper．The bark being separated from the wood is steeped in water，and the inner bark separated from the outer；the former making the whitest and best paper． The bark is next slowly boiled，then washed，and afterwards put on a wooden table and beaten into a pulp． This pulp being put in water，separates like grains of meal．An infusion of rice and the root of manihot is next added to it．From the liquor so prepared，the sheets of paper are poured out one by one，and when pressed，the operation is finished．

The juice of this tree is sufficiently tenacious to be used in China as a glue，in gilding either leather or paper．The finest and whitest cloth worn by the principal people at Otaheite and in the Sandwich Islands is made of the bark of this tree．The cloth of the Bread－fruit tree is inferior in whiteness and softness，and worn chiefly by the common people．

2060．Schefferia．So called after James Christian Schæffer，a German naturalist of celebrity，who is best known by his excellent work on the Fungi of Bavaria，published in 1762．An inelegant shrub with green flowers．

13877 Leaves ovate lanceolate oblique at base finely and simply serrated smooth
13878 Leaves oblong stellate-hairy above brownish white and scaly beneath
13879 Leaves linear-lanceolate smooth above white with scales beneath

13880 Leaves 3-5-lobed acuminate serrated scabrous
13881 Leaves cucullate entire

\section*{13882 Flowers tetrapetalous axillary}

13883 Leaves opposite stalked pinnated with an odd one of 5 or 6 pairs 13884 Leaflets serrated villous beneath, Racemes often compound

13885 Leaves somewhat whorled linear smooth

13886 Unarmed, Leaves oblong acum, entire smooth, Fruit 1-seeded cornute, Horns reflexed shorter than fruit 13887 Unarmed, Leaves obovate oblong acuminate unequally serrate very scabrous on each side

13888 Leaves alternate oblong oval, F1. solitary

\section*{PENTANDRIA.}

13889 Leaves pinnated with an odd one, Leaflets 5 ovate tapered at base rather acute and mucronate at end 13890 Leaves pinnate and ternate, Leaffets roundish narrowed at base netted with veins retuse mucronate

13891 Leaves pinnate with an odd one, Leaflets about 7 ovate-lanceolate rounded at base acute mucronate 13892 Leaves pinnate with an odd one, Leaflets lanceolate about 9 , Petiole winged between the terminal pairs

and Miscellaneous Particulars.
2061. Brucea. Named in honor of James Bruce, a celebrated Scotch traveller in Abyssinia, who discovered the plant.
2062. Anthospermum. From cy \(9 \circ \varsigma\), a flower, and \(\sigma \pi \varepsilon \rho \mu n\), seed; its female flower is entirely naked, consisting of a single ovarium; whence its name. A heath-looking evergreen, the leaves of which are fragrant when bruised, and the propagation and culture of the easiest description.
2063. Trophis. From \(\tau \rho \in \notin a\), to nourish. T. americana produces berries about the size of large grapes, and of an agreeable pleasant flavor. The leaves and twigs are used as fodder for cattle when grass is scarce. Cuttings root in sand under a glass.
2064. Montinia. In honor of Laurence Montin, a Swede, who published a little tract upon Splachnum. The specific name seems to hint at the nature of his disposition. A little worthless weed-like Cape plant.
2065. Pistacia. Said by Forskahl to have been altered by the Latins from its Arabic name foustaq. P. officinalis abounds in Sicily, where it is cultivated for its nuts. The male flowers come out from the side of the branches in loose bunches, and are of an herbaceous color. The female flowers come out in the same manner in clusters. The male puts forth its flowers first, and some gardeners pluck them whilst yet shut, dry them, and afterwards sprinkle the pollen over the female tree: but the method usually followed in Sicily, when the trees are far asunder, is to wait till the female buds are open, and then to gather bunches of male blossoms ready to blow; these are stuck into a pot of moist mould, and hung upon the female tree till they are quite dry and empty. This operation is called tuchiarare, and never fails to produce fructification ; sometimes the gardeners ingraft the male bud upon the female tree.
P. Terebinthus (from \(\tau \in g \varepsilon \omega\), to cut) furnishes the Cyprus turpentine. It is procured by wounding the bark of the trunk in several places, during the month of July, leaving a space of about three inches between the wounds; from these the turpentine is received on stones, upon which it becomes so much condensed by the coldness of the night, as to admit of being scraped off with a knife, which is always done before sunrise: in order to free it from all extraneous admixture, it is again liquified by the sun's heat, and passed through a strainer; it is then fit for use. The quantity produced is very inconsiderable; four large trees, sixty years old, only yielding two pounds nine ounces and six drachms; but in the eastern part of Cyprus and Chio, the trees afford somewhat more, though still so little as to render it very costly, and on this account it is commonly adulterated, especially with other turpentines. The best Chio turpentine is generally about the corsistence of thick honey, very tenacious, clear, and almost transparent, white, inclining to yellow, and of a fragrant smell, moderately warm to the taste, but free from acrimony and bitterness.
P. Lentiscus (lentiscere, to be sticky) produces the mastick, which is obtained most abundantly, by making transverse incisions in the bark of the tree, whence the mastick exudes in drops, which are suffered

1.9509 The only species

and Miscellaneous Particulars.
loamy soil about the end of April: the male plants are generally pulled about the beginning of July, and the females four or five weeks after them, when they have ripened their seeds. The plants being tied in bundles, are watered and bleached, in the same manner as flax; or they are dried and stacked without having gone through this process, and the fibres separated when wanted by the flax-breaking machine of recent invention, or by steeping in hot water and soft soap. The produce of hemp in fibre varies from three to six hundred weight per acre; in seed, from eleven to twelve bushels. The fibre produces a cloth stronger than that from flax, and the best of all cordage and ropes. An oil is extracted from the seeds of hemp, which is used in cookery in Russia, and in this country by painters. The seeds themselves are reckoned a good food for poultry, and are supposed to occasion hens to lay a greater quantity of eggs. Small birds in general are very fond of them, but they should be given to caged birds with caution, and mixed with other seeds. A very singular effect is recorded, on very good authority, to have been sometimes produced by feeding bullfinches and goldfinches on hemp-seed alone, or in too great quantity; viz. that of changing the red and yellow on these birds to a total blackness. (Ency. of Agr. 5327.)
2074. Humulus. From humus, fresh earth; the hop grows only in rich soils. Our English word hop, seems to be the Anglo-Saxon hoppan, to climb. Lupulus is a contraction of Lupus salictarius, the name by which it was, according to Pliny, formerly called, because it grew among the willows, to which, by twining round and choking up, it proved as destructive as the wolf to the flock.
The hop has been cultivated in Europe an unknown length of time for its flowers, which are used for preserving beer. Its culture was introduced from Flanders in the reign of Henry VIII., though indigenous both in Scotland and Ireland: it is little cultivated in those countries, owing to the humidity of their autumnal season. Like other plants of this sort, the hop bears its flowers on different individuals; the female plant, therefore, is alone cultivated. There are several varieties grown in Kent and Surrey under the names of Flemish, Canterbury, Goldings, \&c. ; the first is the most hardy, differing little from the wild or hedge-hop; the Goldings is a very improved and highly productive variety, but more subject to the blight than the other. The hop prefers a deep loamy soil on a dry bottom; a sheltered situation exposed to the south or south-west, but at the same time not so contined as to prevent a free circulation of air. The soil requires to be well pulverized and manured previously to planting. In hop districts, the ground is generally trenched either with the plough or spade. The mode of planting is generally in rows, six feet apart, and the same distance in the row, Five, six, or seven plants are generally placed together in a circular form, and at a distance of five or six feet from each other. The plants or cuttings are procured from the most healthy of the old stools; each should have two joints or buds; from the one which is placed in the ground springs the root, and from the other the stalk. Some plant the cuttings at once where they are to remain, and by others they are nursed a year in a garden. An interval crop of beans or cablages is generally taken the first year. Sometimes no poles are placed at the plants till the second year, and then only short ones of five or six feet. The third year the hop generally comes into full bearing, and then from four to six poles from fourteen to sixteen feet in length are placed to each hill. The most durable timber for poles is that of the Spanish chesnut, which is much grown

History, Use, Propagation, Culture,
in Kent as coppice wood for that purpose. The after-culture of the hop consists in stirring the soil, and keeping it free from weeds; in guiding the shoots to the poles, and sometimes tying them for that purpose with withered rushes; in eradicating any superfluous shoots which may arise from the root, and in raising a small heap of earth over the root to prevent any more shoots from arising.
Hops are known to be ready for gathering, when the chaffy capsules acquire a brown color, and a firm consistence. Each chaffy capsule or leafed calyx contains one seed. Before these are picked, the poles with the attached stalks are pulled up, and placed horizontally on frames of wood, two or three poles at a time. The hops are then picked off by women and children. After being carefully separated from the leaves and stalks, they are dropped into a large cloth hung all round withinside the frame on tenter-hooks. When the cloth is full, the hops are emptied into a large sack, which is carried home, and the hops laid on a kiln to be dried. This is always done as soon as possible after they are picked, as they are apt to sustain considerable damage, both in color and flavor, if allowed to remain long in sacks in the green state in which they are pulled. In very warm weather, and when they are pulled in a moist state, they will often heat in five or six hours : for this reason the kilns are kept constantly at work, both night and day, from the commencement to the conclusion of the hop-picking season. The operation of drying hops is not materially different from that of drying malt, and the kilns are of the same construction. The hops are spread on a hair-cloth, from eight to twelve inches deep, according as the season is dry or wet, and the hops ripe or immature. When the ends of the hopstalks become quite shrivelled and dry, they are taken off the kiln and laid on a boarded floor till they become quite cool, when they are put into bags.
The bagging of hops is thus performed : in the floor of the room where hops are laid to cool, there is a round nole or trap, equal in size to the mouth of a hop-bag. After tying a handful of hops in each of the lower corners of a large bag, which serve afterwards for handles, the mouth of the bag is fixed securely to a strong hoop, which is made to rest on the edges of the hole or trap; and the bag itself being then dropped through the trap, the packer goes into it, when a person who attends for the purpose, puts in the hops in small quantities, in order to give the packer an opportunity of packing and trampling them as hard as possible. When the bag is filled, and the hops trampled in so hard as that it will hold no more, it is drawn up, unloosed from the hoop, and the end sewed up, other two handles having been previously formed in the corners in the manner mentioned above. The brightest and finest colored hops are put into pockets or fine bagging, and the brown into coarse or heavy bagging. The former are chiefly used for lrewing fine ales, and the latter by the porter brewers. But when hops are intended to be kept two or three years, they are put into bags of strong cloth, and firmly pressed so as to exclude the air.
The stripping and stacking of the poles succeeds to the operation of picking. The shoots or bind being stripped off, such poles as are not decayed are set up together in a conical pile of three or four hundred, the centre of which is formed by three stout poles bound together a few feet from their tops, and their lower ends spread out.

The produce of no crop is so liable to variation as that of the hop; in a good season an acre will produce 20 ewt. ; in a bad scason none, or only 2 or 3 cwt . From 10 to 12 cwt . in a season is considered a tolerable average

and Miscellaneous Particulars.
crop. The quality of hops is estimated by the abundance or scarcity of an unctuous clammy powder which adheres to them, and by their bright yellow color.

The expences of forming a hop plantation are very great ; but once in bearing, it will continue so for ten or fifteen years before it requires to be renewed. The hop culture in England, like that of the culture of the vine in France, is only calculated for cultivators of considerable capital, who can retain the produce from years of abundance to years of scarcity. It is calculated on an average, that the hop crop fails almost entirely every fifth year, when the price will rise from two to thirty pounds per cwt. To those who can cultivate and preserve the hop with a view to such a rise, few crops will be equally profitable.

The hop is peculiarly liable to diseases; when young it it devoured by fleas of different kinds; at a more advanced stage it is attacked by the green fly, red spider, and otter moth, the larva of which prey even upon its roots The honey dew often materially injures the hop crop; and the mould, the fireblast, and other blights injure it at different times towards the latter periods of the growth of the plants,

The use of hop in brewing is to prevent the beer from becoming sour, and this is the grand purpose for which it is cultivated, But the young shoots both of the wild and improved hops are eaten early in the spring as asparagus, and were formerly brought to market for that purpose. The stalk and leaves will dye wool yellow. From the stalks a strong cloth is made in Sweden, the mode of preparing which is described by Limnæus in his Flora Suecica. A decoction of the roots is said to be as good a sudorific as Sarsaparilla; and the smell of the flowers is soporific. During the illness of George the third, in 1787, a pillow filled with hops was used instead of opiates.
2075. Modecca, is an Indian word by which two or three species of this genus appear in the Hortus Mala.. baricus, and has been adopted as a generic name by Lamarck. A curious plant resembling a bryony, of easy culture and propagation.
2076. Xerotes. From zngos, dry, on account of the aridity of the herbage and of the situations in which it grows.
2077. Elais. The natives of Guinea express oil from the fruit of this, as the Greeks from their olives, Eגouo, whence its name. This palm bears a fruit about the size of a large plum. The inhabitants of the West India Islands draw an oil from it, by the same process used in extracting oil from olives. From the sap an inebriating liquor is fermented, and the negroes weave the leaves into mats, on which they repose.
 sense in which the name has been applied.
9079. Borassus. This is one of the names which were applied to the spatha of the date; and was applied by Linnæus to the designation of this family of palms. The fruit of this palm is of the size and shape of a child's head; a wine and a sugar are made from the sap of the trunk.
2080. Mauritia. Named in honor of Prince Maurice of Nassau, the patron of Piso, for whom he obtained the necessary aid towards publishing his Natural History of Brazil. A fine genus of palms.
2081. Smilax. From \(\sigma \mu \lambda_{44}\) a grater; the stems are rough with stiff prickles. S. aspera has roots not mulike those of the Sarsaparilla. They have the same qualities, but in an inferior degree ; and may be distinguished by

History, Use, Propagation, Culture,
being larger, more porous, and much less compressed. S. Sarsaparilla (zarza, furze, Spanish) has long slender roots covered with a wrinkled brown bark, white within, and having a small woody heart. It is inodorous, and has a mucilaginous very slightly bitter taste. Medicinally it is demulcent and diuretic. It was brought to Europe about the year 1530, and introduced as a medicine of great efficacy in the cure of lues venerea; but it fell into disrepute and was little used, till it was again brought into esteem by Dr. William Hunter and Sir William Fordyce, about the middle of the last century; not, however, as a remedy fitted to cure syphilis, but of much efficacy in rendering a mercurial course more certain, and after the use of mercury. Experience, however, has not verified the encomiums bestowed on it ; and the extensive observations of Mr. Pearson have fixed the degree of benefit which is to be expected from this root in syphilitic complaints. The contagious matter and the mineral specific may, he observes, jointly produce, in certain habits of body, a new series of symptoms, which, strictly speaking, are not venereal, which cannot be cured by mercury, and which are sometimes more to be dreaded than the simple and natural effects of the vencreal virus. Some of the most formidable of these appearances may be removed by sarsaparilla, the venereal virus still remaining in the system; and when the force of the poison has been completely subdued by mercury, the same vegetable is also capable of freeing the patient from what may be called the sequelæ of a mercurial course. Sarsaparilla is also recommended in scrophula, elephantiasis, or cutaneous affections resembling it, and in chronic rheumatism; but its efficacy is doubtful. (Thom. Lond. Disp. 505.)
S. China has roots as long as a child's hand, twisted, full of knots, reddish on the outside, flesh-colored in the heart, and destitute of smell. It is employed both as food and medicine in China, and to feed hogs in the West Indies. None of the species are of much beauty or worth growing, but as objects of curiosity.
2082. Tamus. This name was employed by Columella and others, for a plant resembling a vine, and bearing fruit not unlike grapes; a description which does not apply badly to the modern plant. T. communis has very large tuberous black coated masses attached to its roots. These are so acrid, that the pulp has been formerly used as a stimulating plaster. The young shoots, however, are so mild as to be good eating when dressed like asparagus. The Moors eat them boiled with oil and salt. The flowers of the female plant are succeeded by ovate smooth berries.
2083. Testudinaria. So called from the resemblance which the great rugged cracked root of this plant bears to the shell of a tortoise (fcstudo). The rootstock is a large fleshy mass, covered with a thick bark cracked deeply in every direction. The Hottentots in time of scarcity make use of the fleshy inside of the root as a sort of yam.
2084. Rajania. Named in honor of our distinguished countryman John Ray, a distinguished naturalist,

and Miscellaneous Particulars.
born in 1628, died in 1705, and author of many works of the highest reputation. His zoological arrangement is still regarded with much respect. Twining plants resembling the Yam.
2085. Dioscorea. In memory of Pedacius Dioscorides, a Greek physician, born at Anazarba, in Cilicia. He is generally believed to have lived under Nero, but this is very uncertain. Abulfarrage makes him to have flourished under Ptolemæus Physcon; but he is not generally credited. D. sativa, Iguame, Fr., and Inhame, Portug., has large thick tubers, a foot broad, and palmated like some Orchises. The stalks are slender, and with the leaves bear some resemblance to black bryony. The yam is largely cultivated for food in Africa and the East and West Indies, especially in the latter for the negroes. The roots grow to a great size, are mealy, and esteemed to be easy of digestion; they are palatable, and not inferior to any roots now in use, either for delicacy of flavor or nutriment. They are eaten instead of bread, either roasted on the embers or boiled; the flower is also made into bread and puddings. In Otaheite they make a dish, which they esteem very delicious, from the roots of the yam, with the kernel of the cocoa-nut scraped, and the pulp of the Musa or Banana. The juice of yam-roots fresh is acrid, and excites an itching on the skin. There are many varieties of these roots, some spreading out like the fingers (Rumph. t. 121.); others twisted like a serpent (Rumph. t. 122.) ; others again very small, scarcely weighing more than a pound, with a whitish ash-colored bark, whereas the bark is commonly black. The flesh of the yam is white or purplish, and viscid, but becomes farinaceous or mealy when dressed.
D. aculeata, by some considered only an improved variety of the sativa, is universally cultivated in the East and West lndies, in Africa, and in all the islands of the southern ocean within the torrid zone, and even as far as New Zealand. The tubers are frequently three feet long, and weigh thirty pounds. All the edible species and varieties are propagated in foreign countries like the common potatoe, but they arrive much sooner at maturity. The buds of the roots are not apparent, but still a small piece of skin is left to each set; for from this piece of bark alone the shoots proceed. Holes are made in rows two feet apart, and at eighteen inches distant in the row; into those holes two or three sets are put, first covered with earth, and then with a little haulm or rubbish to retain moisture. The only after-culture consists in hoeing up the weeds. They are commonly planted it August, and are ripe about the November or December following. When dug up, the greatest care is taken not to wound them, as that occasions them to sprout much earlier than they otherwise would do. They should be rubbed over with ashes, and piled regularly on beds or hurdles raised above the floor, that the air may come easily between them; or, if they be piled in heaps, some ashes should be strewed between the layers. None of the species are worth cultivating as ornamental plants; but some of the edible sorts have been raised in hotbeds in the Paris garden, and being transplanted early into a warm situation, have produced tubers of a considerable size.

\section*{ENNEANDRIA.}

2085. Maba. The name given to the plant by the natives of Tonga-Tabu, according to Forster. (Gen. 61.) This shrub or small tree produces edible berries very well tasted. The wood is dark colored, remarkably hard and durable, and where its size will admit, is employed for such uses as require the most durable, compact, and heavy timber.
2086. Populus. In ancient times the public places of Rome were decorated with rows of this tree, whence it came to be called arbor populi, as being a tree peculiarly appropriated to the people. But Bullet asserts, that the Poplar has obtained its name from the constant motion of the leaves, which are in a perpetual state of agitation like the populace. All the species are rapid-growing soft-wooded timier trees, some of which attain a very great size. P, alba is one of the most valuable of the British species. The leaves of the common gray poplar are of a blackish-green above, but having a thick white cotton underneath; they are about three inches long, on petioles a foot in length. The leaves of the Abele are about double the size, and divided into three, four, or five lobes. The leaves of the gray poplar are also larger more deeply lobed, and the under-side of the leaves and young shoots are covered with a hoary down. The Abele is said to have been introduced from Flanders, and the hoary poplar to have been originated in this country. The timber is of great value for all sorts of wooden vesseis, especially butchers' trays. It is of quick growth, soft, white, and stringy, and little subject to swell or shrink. It makes beautiful floors and turners' ware. Some of the finest Abeles in England are at Hartwell near Aylesbury.
P. tremula is commonly called the asp, from the German espe, which is the general name for all poplars, is a rapid-growing tree in almost any soil or situation: but the numerous shoots of the roots spread so near the surface that they will not permit any thing else to grow there. The wood is extremely light, white, smooth, soft, and durable in the air. It may be used for the same purposes as that of the Abele. The bark is the favorite food of beavers. On the leaves and leafstalks may sometimes be seen red glandular substances about the size of a pea, which are the nests of Tipula juniperina. P. nigra has anaked lofty trunk covered with an ash-colored bark, and a regular handsome head. It is a tree of quick growth, and on the banks of rivers and in moist situations it grows up to a great height in a short time. The bark is light like cork, and is sometimes used by fishermen to float their nets. The timber is light and soft, fit for the turner and pattenmaker, and excellent for flooring-boards, These boards are much siower in taking fire than those of resinous trees; they smoke a long time before they burst into a flame: of course the wood is bad for fuel. Many species of insects are supported by this and the other poplars. The red substance like berries upon the leafstalks of this species are occasioned by the Aphis Bursonia. The leaves and young shoots are gathered in Sweden and other parts of Europe during the month of October and dried, to be given as fodder to the sheep in winter. The practice is as old as the time of the Romans; who, as well as the modern Italians, planted this tree for their vines to run on. In Kamchatka the inhabitants are sometimes reduced to the necessity of converting the inner bark into bread. Scheffer made paper from the cotton down of the seeds. The buds both of this and the white poplar smell very pleasant early in the spring, and being pressed between the fingers yield a balsamic resinous substance, which, extracted by spirits of wine, smeils like storax. A drachan os this tincture in broth is ardministered in internal ulcers and excoriations.

The black Italian poplar, so much recommended by Poitey, and said by him to have been intro-

and Miscellaneous Particulars.
duced from America, seems intermediate between P. nigra and dilatata; indeed, all the three sorts are by some considered as but one species. P. dilatata differs from the common black poplar chiefly in its close conical manner of growth, whick resembles the cypress. The leaves are greater in breadth than length; whereas in the black poplar the longitudinal diameter is the greatest. Though it generally attains a great height, the increase of the trunk is by no means so rapid as in most of the other poplars. It cannot, therefore, be highly recommended as a timber tree. In ltaly it is considered peculiarly adapted for packing-boxes : nails do not split it; and if cases of this wood fall or are thrown carelessly on the ground, it gives way a little, and returns to its former position without splitting, which oak and other heavy woods will not do. In Lombardy all the vessels in which the grapes are carried home in carts from the vineyards, are of poplar plank, about two inches thick, and in them the grapes are squeezed. Such vessels last thirty or forty years; and by their lightness are manageable, however large and long. A four-wheeled cart is in general covered with one of them, and it contains about fifteen hundred weight of grapes, each hundred being a hundred pounds of thirty ounces. The conic form of the Lombardy poplar, as a deciduous tree, is peculiar. Among evergreens we find the same character in the cypress ; and both trees, in many situations, have a good effect. The cypress often, among the ruins of ancient (and the buildings of modern) Rome, breaks the regularity of a wall or a pedirnent; and the poplar has the effect among deciduous trees of the round-headed kind. One beauty the Italian poplar possesses which is almost peculiar to it ; and that is the waving line it forms when agitated by the wind. Most trees, in these circumstances, are partially agitated; one side is at rest while the other is in motion; but the Italian poplar waves in one single sweep from the top to the bottom, like an ostrich-feather on a lady's head. All the branches coincide in the motion, and the least blast makes an impression upon it when other trees are at rest.
P. balsamifera is a moderate sized conical tree, a native both of Siberia and Amprica. The buds of this tree, from autumn to the leafing season, are covered with abundance of a glutinous yellow balsam, which often collects into drops, and is pressed from the tree for medical use. This balsam is brought to Europe from Canada in shells. It is smooth, of an even texture, a yellowish color, and a fragrant scent. In siberia a medicated wine is prepared from the buds, which is diuretic, and esteemed by the inhabitants serviceable in the scurvy. The grouse and other birds of that family feeding on these buds during winter, acquire a flavor which is much esteemed by epicures. P. candicans bears a general resemblance to the preceding species; and, like it, the buds are covered with a resinous tenacious balsam. The other American species are rapid-growing bulky timber-trees, well calculated for immediate effect and utility; but all the species being short-lived when compared with oaks, elms, and other slower-growing hard-wooded trees, confer a temporary premature character on landscape; for nothing can be great and lasting but what advances by degrees. Such poplars as do not grow freely from cuttings of the shoots, are most rapidly increased by cuttings of the roots; but the largest plants are produced from layers.
2087. Mercurialis. Mercury is said to have discovered the virtues of this plant. Böhmer, indeed, in his Lexicon, says, after Ambrosinus, that the name is a corruption of muliercularis, as being useful to women; but the Greeks call it ifp\& roo, which is the same as Mercurialis in its mythological sense. M. perennis is not eaten by any quadruped, and is poiscnous to men and sheep. The plant on being dried turns blue, and stecped in water it

History, Use, Propagation, Cuture,
affords a fine deep blue color, destructible, however, both by acids and alkalies. It has been observed that the male and female plants are seldom found intermixed, each sort usually growing in large patches; whence it is probable that this plant, which increases much by the root, rarely produces perfect seeds. M. annua was formerly accounted medicinal ; its seeds taste like those of hemp.
2089. Hydrocharis. From idw, water, and xœpıs, grace. This little plant is one of the prettiest ornaments of still waters. This plant increases by runners, which shoot out to a great length, and at the joints drop down long roots, which penetrate deep into the mud. The joints are furnished with pendulous buds, supported on long footstalks. The buds consist of two stipulaceous scales folded together, within which are curiously enveloped the embryo leaves of the future plant.
2090. Triplaris. All the parts of the fructification are in threes or triple. T. americana is a tree forty feet high, with a dense pyramidal head. The leaves are oblong, entire, smooth, a span long. The branches are often hollow, and are then filled with an innumerable quantity of little red ants, which are often showered down upon any incautious traveller who may stand under the shade of the tree, and whom they bite severely, (Bredemeyer.)
2091. Coriaria. A tanner's plant; from corium, a hide. Coriaria myrtifolia has handsome leaves, but very little beauty in the flowers. It is considerably astringent, and is used not only in tanning leather, but in dying black colors. It produces abundance of suckers.
2092. Kiggelaria. Named after Francis Kiggelar, an obscure botanist, who lived at the end of the seventeenth century. An uninteresting plant. Ripened cuttings strike in beat under a hand-glass.
2093. Schinus. This was the Greek name of the Pistacia Lentiscus. It is now applied to an American genus which resembles Pistacia in sensible properties. The word molle, applied to one species, does not allude to any softness in the plant which bears the name, but is a slight alteration of the Peruvian word mulli. Fragrant shrubs with beautiful foliage, easily cultivated in a cold conservatory or out of doors in a warm sheltered place.
2094. Gymnocladus. From zupvos, naked, and z \(\alpha \alpha \delta 05\), a shoot, on account of the naked appearance of its strange rigid shoots during the winter. This tree or shrub has pinnate leaves nearly a foot and a half long; both leaves and stalks are armed with thorns. The stalks at first grow erect, but afterwards twine about the neighbouring trees and shrubs. It is best propagated by cuttings of the roots.

13977 Stem suffruticose brachiate, Leaves elliptical acute at each end smooth glandular serrated 13978 Stem suffruticose, Leaves oblong downy with serratures on each side at the end

13993 Branches diffuse cinereous scarred, Leaves opposite 3 or 4-nate oblong retuse corraceous
13994 Leaves oblong or obovate flat
15995 Leaves obovate wavy

and Miscellaneous Particulars.
2095. Carica. According to Linnæus, because a native of Caria; but as the plant has no relation to that country, it would be better to adopt, with Jussieu, the specific name Papaya for the genus. C. Papaya rises with a thick soft herbaceous stem to the height of eighteen or twenty feet, naked till within two feet of the top, and having marks of the fallen leaves great part of its length. The leaves have long footstalks, are very large, and divided into many lobes. The whole plant abounds with a milky acrid juice, which is esteemed good for the ringworm. The male flowers, which are in loose clusters on long peduncles, are of a pure white, and have an agreeable odor. Sometimes these are succeeded by a small fruit about the size of a pear, which has occasioned some to suppose the male plant a distinct species. The flowers of the female have short peduncles; they are large and bell-shaped, composed of six yellow petals. When these drop off, the germ swells to a large fleshy fruit the size of a small melon. When ripe it is eaten by the inhabitants of the Caribbee Islands, but its flavor is very indifferent. The most common use of them is when they are about half grown, to soak them in salt water, to get out the milky juice, and pickle them as mangoes, for which they are considered a good substitute. The plant generally is said to have the property of intenerating animal fibre by suspension under its leaves or branches; but this quality wants confirmation. In our stoves the plants grow freely in loamy soil, and are increased by large cuttings with their leaves on in a moist heat.
2096. Stratiotes. From Jfearos, a camp; in English, water-soldier; both names alluding to the military appearance of the plant, with its long sword-like leaves, and fowers which may be liked to plumes of white feathers. An aquatic plant, remaining the greatest part of the year immersed in water, but rising to flower. It increases with such rapidity as to become a troublesome weed in artificial pieces of water in which it is planted.
2097. Hyenanche. From hycena, and \(\alpha \gamma x \eta\), pain; because the fruit is used at the Cape of Good Hope to poison hyænas. A small tree, six or seven feet high, also called Toxicodendron capense. The fiowers grow in axillary branched yellowish panicles, and are succeeded by smooth nuts, which, being pounded, are used to poison the carcases of lambs, by which the hyænas are infallibly destroyed.
2098. Euclea. From \(\varepsilon v \approx \lambda \epsilon s \alpha\), glory or beauty; in allusion to the permanent beauty of the neat evergreen foliage of the plants. Shrubs or small trees, natives of the Cape of Good Hope, Of one species the berries are brought to the market of Cape Town for sale, and is the only kind of native fruit, except that of Cissus capensis, which is there eaten. Ripened cuttings root in sand under a glass.

History, Use, Propagation, Culture,
2099. Datisca. A word the meaning of which is unknown. The plant is of no beauty, and of the easiest culture. 2100. Menispermum. From unvn, the moon, and \(\sigma \pi s \rho \mu x\), seed; on account of the crescent-like form of the fruit. All the species are of the easiest propagation and culture-
The M. palmatum produces the famous Colombo root, which is so remarkable for the intenseness of its bitter taste, and valuable on this account in dyspepsia, diarrhcea, dysentery, and as a wash for putrid sores.
2101. Cocculus. This word is derived from coccus, the name of the well-known dyers' insect, and has been applied to this genus on account of the resemblance which has been found to exist between that insect and the scarlet berries of the plant. A genus with the habit of Menispermum.

Cocculus Plukenetii produces berries and bunches like grapes, but smaller ; first white, then red, and finaliy blackish purple. In the East Indies they are made up into a paste, and used to intoxicate fish, birds, and different sorts of vermin.
2102. Flacourtia. Named in honor of Etienne de Flacourt, a director of the French East India Company, and the commander of an expedition to Madagascar in 1648; of which he afterwards wrote an account, containing considerable details upon the botany of the country. L'Heritier dedicated to him the first species of the genus, which was found by him in Madagascar, where it is called Ramontchi. It is a thorny shrub or tree, with leaves and fruit resembling those of the plum. The fruit is green when young, of a beautiful red when ripe, and finally of a dark violet color: the skin is very thin, and the flesh transparent red, of the same consistence with our common plums : in the middle are a dozen or fourteen small kernels, the size of those in the apple, and nearly of the same shape; they are bitterish like our apricot kernels, and covered with a tender shell. The natives eat the fruit; it is sweet, but leaves a slight sharpness in the mouth. An island on the coast of Madagascar is covered with these trees; and because they resemble the European plum-tree, the sailors have named the island Isle aux Prunes, or Plum-tree Island. All the species grow freely in a mixture of loam and peat, and cuttings root in sand, plunged and covered.
2103. Peumus, The Chilian name of this plant is Peumo. It is the Ruizia of the Flora Peruviana, and forms an evergrsen tree among the woods upon the sandy shores of Chili; it is valuable for its wood, which is very fragrant.

2104. Gelonium, So named by Roxburgh; but it is not known with what meaning. East Indian trees, with alternate leaves, the tubular stipular of a Ficus, and axillary flowers
2105. Rottlera. Named by Roxburgh, in honor of the Rev. Dr. Rottler, an East Indian botanist of reputation, who resided many years at Tranquebar in the character of a Danish missionary. Rottlera tinctoria is a native of the inland mountainous parts of the Circars of Hindostan, flowering in the cold season. Dr. Roxburgh never found it any where else. This is a middle-sized, erect, branching tree. Leaves alternate, stalked, elliptic, oblong, acute, entire, from four to eight inches in length, three-ribbed, and veiny; nearly smooth above ; downy beneath, furnished at their base with two brown glands. Footstalks round, downy, from one to three inches long. Flowers small, in clusters about the tops of the branches, axillary, and terminal; the latter branched. Capsules the size of a small cherry, clothed with abundance of deep red granular powder, easily rubbed off. This powder is a valuable article of commerce, being much esteemed, especially among the Moors, for dyeing silk of a deep, bright, very beautiful and durable, full orange or flower color. When the capsules are ripe, in February or March, they are gathered, and the powder carefully brushed off. It is preserved without any further process, and is sold to the merchants trading to Hydrabad and other inland parts. This substance is but little acted upon by water, except with the admixture of alkaline salts, when it gives out a very deep blood-red color. To spirits it communicates a rich, deep, reddish flame color; but in neither instance does it dissolve, the grains remaining entire, like sand. The inhabitants know this powder by the name of Wassunta-gunda, and use it in the following manner:- To four parts of Wassunta-gunda are added one of alum, and two of salt of soda, native barilla. These are rubbed well together, with a portion of expressed oil of Sesamum, so small as hardly to be perceived. When well mixed, the whole is put into boiling water, in quantity proportioned to the silk which is to be dyed, and kept boiling smartly, more or less time, according to the shade required. The silk is turned frequently, to render the color uniform.
2106. Clifortic. Named in honor of George Cliffort, a Dutch gentleman; a great lover of plants, and one of the earliest of Linnæus's patrons. He had a superb garden at Hartcamp, of which Linnæus published the catalogue in one volume folio, in 1737. Shrubs of little beauty, except C. pulchella, which is exceedingly pretty; they are easily cultivated in a good greenhouse.

\section*{MONADELPHIA.}

History, Use, Propagation, Culture,
2107. Cycas. A name employed by the ancients to designate a little palm which grew in Ethiopia. The modern plant is analogous to it. This genus, which seems intermediate between palms and ferns, produces the nutritive granulated powdercalled sago, from sagu, the name of a sort of bread made from the pith of the trunk in Tonquin. It is cultivated in China and Japan, and the fruit is eaten in the latter country. The tree, however, is chiefly valued for the pith of its trunk, which is full of white pith like that of the elder. The tree being cut down, this pith is beaten with a wooden pestle in a great mortar or trough ; it is then strained, and the sediment, without farther preparation, constitutes sago. The native Indians live wholly upon it for three or four months in the year. That which is transported is dryed and granulated. In our stoves these plants require the culture common to all the palm tribe; a rich loamy soil, plenty of pot-room, and a strong moist heat.
2108. Zamia. From ¿nuse, loss or damage. Pliny applied the name to the pine-cones of the fir, which, when suffered to decay upon the tree, injured the succeeding crop. The modern genus bears heads of fowers very like pine cones.
2109. Latania. The name of this plant in the Isle of Bourbon is Latanier. L. borbonica is a middle-sized palm with plaited fan-like fronds, which from the elongation of the axis and terminal lobe, seems as if pinnate. When young their middle nerve is downy; it afterwards becomes naked. The stalks of the leaves are spiny. The other species, \(L_{\text {. r }}\) rubra, is a much smaller plant, and is remarkable for its red livid leaves.
2110. Leptocarpus. From \(\lambda \varepsilon \pi \tau 05\), smooth, and \(x_{c} \pi \sigma 5\), fruit; with reference to the polished surface of the seeds. Rushy plants allied to Restio, and all natives of New Holland and the South Seas.
2111. Ruscus. Anciently bruscus, and derived, it is said, from beus, box, and kelem, holly, in Celtic; boxholly. The French at this day call one species buis-épineur and petit-houx. \(\mathbf{R}\). aculeatus has thick white twining roots, which strike deep into the ground, and send out fibres like those of asparagus. The stem is suffruticose, tough, stiff, and dark green; having many stiff sharp prickly pointed leaves. From the middle of the leaf above, comes out a singl flower, on a very short pedicel: when it first appears it is the size and shape of a small pin's head; when expanded, composed of three outer calyxed leaves, and three inner ones con-

and Miscellaneous Particulars.
swdered as petals. Mr. Woodward remarks, that the flower does not properly grow out of the leaf, but on a pedicel from the bosom of the leaf, which is immersed beneath the outer coat, whence it may with ease be dissected. The female flowers are succeeded by red berries, almost as large as some cherries; they are sweet tasted, with two large orange-colored seeds in each. The green shoots were formerly used by butchers for sweeping their blocks, whence the common English name of the plant. It is still made into besoms in Italy. The tender growths, soon after they have sprung up from the root in spring, have been gathered and eaten by the poor like those of asparagus ; and the branches, with the ripe fruit on them, were formerly stuck up in sand, with the stalks of Pcony and Iris, displaying their capsules of ripe seeds; the three together made a sort of winter nosegay for rooms. In landscape gardening the plant is valuable as an evergreen, which will grow under the shade and drip of other trees. It harmonizes well with Daphne Laureola, and Ulex nana, and Vaccinium vitis idæa. R. hypophyllum has the flowers on the under side of the leaves, which are succeeded by small red berries about the size of those of Juniper. R. racemosus is an elegant evergreen shrub, by some supposed to be the plant with which the ancients crowned their victors; but the more general opinion is in favor of Laurus nobilis. All the species are readily increased by suckers from the root,
2112. Araucaria. The inhabitants of Chili call this noble ornament of their forests araucanos. A. excelsa, the Norfolk Island pine, is a most superb plant, growing to all enormous size, and never losing the bright im perishable foliage with which it is covered, as with a coat of mail. This genus, Sweet observes, " may be termed the handsomest genus of plants with which we are acquainted. A. imbricata, in particular, is certainly one of the grandest plants known. It will thrive well in the open air, with the protection of a mat or two in very severe weather, and when got pretty large, will, no doubt, be perfectly hardy. A. excelsa, or Norfolk Island pine, is also a beautiful tree, but will not do without the protection of a greenhouse. An equal mixture of sandy loam and peat will suit them very well; and cuttings may be rooted, though with difficulty, taken off at a joint in ripened wood, and planted in a pot of sand, which must be put under a hand-glass, in the propagating house, thut not plunged in heat." (Bot. Cult. p. 136.)

\section*{History, Use, Propagation, Culture,}
2113. Juniperus. From the Celtic jeneprus, which signifies rough, or rude. Sandarach, the name of a resin produced by the Juniper, is, according to Golius (p. 12\%j.), an alteration of the Arabic word sandaroiks. The species, with only one or two exceptions, are close conical-growing evergreen shrubs or trees. The timber of J. Barbadensis and Bermudiana is imported from the West Indies under the name of Bermudas Cedar. J. Virginiana grows in the West Indies, the North American continent, and in Japan. It is one of the highest timber trees in Jamaica, affording very large boards of a reddish brown color, close and firm contexture, shining, very odoriferous, and bitter to the taste. It is imported into this and various other countries for the purposes of the cabinet-maker, as it is offensive to most insects. J. communis is common in all the northern parts of Europe, in fertile or barren soils, on hills or in vallies, in open sandy plains, or in moist and close woods. On the sides of hills its trunk grows long, but on the tops of rocky mountains and on bogs it is a tufted shrub. In England it is found chiefly on open downs in a chalky or sandy soil. In Scotland it is found in granite, trap and schistous hills and mountains; but not in the highest summits of the latter. In the south of Europe it is only found in elevated situations; it abounds in the Alps of Switzerland, but is not very common in the Appenines. In our shrubberies it forms a respectable looking conical bush, grouping and combining very well with cypresses, A merican cedars, and various species of the pine and fir tribe. It is easily transplanted, and bears cropping. Grass will not grow beneath it, but the Avena Pratensis is said to destroy it. The wood is hard and durable; the bark may be made into ropes; and ardent spirits, impregnated with the essential oil of these berries, forms the true Juniper water or gin. Various insects feed on this shrub; and it is eaten by horses, sheep, and goats, when they can get nothing better. A gum oozes spontareously from the trunk of old plants, which is Sandarach, and in its powdered form is known under the name of pounce. Juniper berries require to remain two years on the tree before they are fully ripe. The greater quantity of those which are used in Britain, are brought from Germany, Holland, and Italy. They have a peculiar aromatic odor, and a sweetish, pungent, bitterish taste when chewed. In distillation with water, they yield a volatile terebinthinate oil of a greenish color, on which their virtues depend. The flavor and diuretic properties of hollands depend on this oil; it is also supposed to be used for flavoring. English gin, but for this purpose oil of turpentine is used, Medicinally, Juniper berries are diuretic and cordial. They have been long known as a remedy in hydropic affections; but they cannot be depended on alone, although they form an excellent adjunct to foxglove and squill. The tops yield the same essential oil as the berries, and may therefore be substituted for them. (Thom. Lond. Disp.)
J. suecica is by some considered only a variety. J. sabina seldom produces flowers or seeds in our gardens. Professor Pallas says, that in the Chersonesus Taurica, where it is very common, the savin is often found a foot and a half diameter; that it grows upright there, like a cypress, whereas by the Tanais it is procumbent the branches extending on the sand several fathoms; that the wood very much resembles that of J. lycia, but has a more cadaverous smell, and the leaves are more fetid. The leaves and tops of common savin have a strong, heavy, disagreeable flavor, and a bitter hot taste, with a considerable degree of acrimony. These qualities depend on an essential oil, which is obtained in considerable quantity by distillation with water. Both water and alcohol extract its active principles; and Lewis found that on inspissating the spirituous tinctrire, there remains an extract consisting of two distinct substances, of which one is yellow, unctuous or oily, bitterish, and very pungent; the other black, resinous, tenacious, less pungent, and subastringent. Medicinally, savin is a powerful stimulant, posssesing diaphoretic, emmenagogue, and anthelmintic properties. It has certainly, however, a considerable effect on the uterine system; but, on account of its stimulating properties, is suited to those cases only of amenorrbea which are unattended by fever, and in which the circulation is

14067 Leaves peltate subcordate ovate-orbicular silky beneath, Female racemes longer than leaves

and Miscellaneous Particulars.
languid. In plethoric habits, its use should be preceded by repeated bleedings ; and at all times its internal exhibition requires caution. It has been given in gout and worm cases also, but is seldom used. As an external local stimulant or escharotic, the dried leaves in powder are appiied to warts, flabby ulcers, and carious bones; and the expressed juice diluted, or an infusion of the leaves, as a lotion to gangrencus sores, scabies. and tinea capitis, or mixed with lard and wax as an issue ointment. (Thom. Lond. Disp. p. 342.)
J. Lycia, which greatly resembles the savin, is commonly thought to produce the gum resin called Olibanum; though Dr. Thomson and others consider the Boswellia Serrata of Roxburgh as the true plant. Olibanum is supposed to have been the incense used by the ancients in their religious ceremonies; it is much employed by the Roman Catholics in their churches, and generally as a perfume in sick rooms.
2114. Taxus. According to Vossius this word is derived from rokos, an arrow, because that weapon was formerly poisoned with the juice of the plant. Yew seems to be an alteration of the Celtic iw, green. T. baccata inhabits mountainous woods in Europe, North America, and Japan. Cæsar mentions it as very common in Gaul and Germany. In Britain and Ireland there was formerly great abundance in a wild state, and planted in church-yards. Ray says that our ancestors planted the yew in church-yards because it was an evergreen tree, as a symbol of that immortality which they hoped and expected for the persons there deposited. Hence a custom, which still exists in a few places of Wales and Ireland, of carrying twigs of this and other evergreen trees in funerals, and throwing them into the grave with the corpse. According to some, the yew was planted in church-yards on account of its utility in making bows; but this is by no means likely, when the tree was so common in a wild state, and when a single one would have afforded so very scanty a supply. The bow was considered an engine of military warfare, at least up to the time of Henry VIII. ; so great was the demand for yew in the days of archery, that our own stock could not supply the demand; it was obliged to be imported, and various laws were passed concerning it from the time of Edward IV. to Elizabeth. The wood of the yew is red and veined, very hard and smooth, used by turners, cabinet-makers, millwrights, and a variety of other artisans. Flood-gates for ponds made of it, are said to be of incredible duration. The twigs and leaves of yew, eaten in a very small quantity, are certain death to horses and cows; but deer, it is said, will crop these trees with impunity, and sheep and goats are said by Linnæus to eat them. Turkeys, peacocks, and other poultry and birds eat both the leaves and fruit. A few of the berries are not deleterious to the human species, but the leaves are fatal. The tree is very patient of the shears, and was much employed in the ancient style of gardening for verdant architecture andi sculpture. Allowed to take its natural shape, and when advanced to a considerable age, it forms one of handsomest of British evergreens, harmonizing admirably with the holly, the box, and the juniper. The yew is generally propagated from seeds, which are either sown as soon as they are ripe, without clearing them from the pulp, or mixed with sand, and laid in a heap to be turned over two or three times during the winter, and in spring, the seeds from which the pulp will have rotted sown in beds of light loamy soil. By either mode, a part of the plants will come up the first season, and the remainder in that following. The Irish yew is probably a distinct species.
2115. Ephedra. This was a name given by the Greeks to our Equisetum, which the plant now called Ephedra strongly resembles. E. Distachya abounds in the southern parts of Russia, and from thence southwards to Persia and India. The berries ripen in July and August: they are sweetish, mucaus, and leave a little heat in the throat. They are eaten by the Russian peasants, and by the wandering hordes of all Great Tartary.

History，Use，Propagation，Culture，
nature of the former in its foliage，and of the latter in its fruit．The roots of several species are said to have powerful medicinal qualities．That of the C．pareira，or Pareira brava，is bitter，diuretic，and aperient；of C．caapeba more mucilaginous．
2117．Excacaria．From excacare，to blind．The juice of this plant is so acrid as to cause loss of sight whenever it touches the eyes．Agallochum，the produce of one of the species，was the name given by the the Greeks to an aromatic wood they obtained from India．In Arabia it is called，according to Golius， âghâloùdjy．
2118．Adelia，From a，privative，and \(\delta\) nnos，visible．The parts of fructification are so minute as to be hardly visible．A．Bernardia derives its name from having been considered a distinct genus，and dedicated to the celebrated Bernard de Jussieu．Bernardia is the name which ought to have been adopted for the genus． Ugly uninteresting shrubs．
2119．Loureira．Dedicated by Cavanilles to John de Loureiro，a Portuguese missionary，who travelled in China and Cochin－china，of which he published the Flora in 1790.
2120．Myristica．From \(\mu v g \rho \infty\) ，myrrh，on account of the odor of the fruit．M．moschata produces spheroidal drupes，fleshy，smooth，and finally drying up into a coriaceous crust，and opening on one side．Each berry contains an ovate，globular，serrated nut．The arillus or cover，which is commonly called mace，is fleshy， coriaceous，and reddish－saffron colored．Under this are two shells，the outer thin and brittle，and reticulated by the impressions of the mace：the inner shell is membranaceous，and adheres very closely to the kernel， The fruit would be a drupe was it not for the arillus．
The nutmeg－tree yields three crops annually ；the first in April，which is the best；the second in August， and the third in December；yet the fruit requires nine months to ripen it．When it is gathered，the outer coriaceous covering is first stripped off，and then the mace carefully separated and dried in the sun．The nutmegs in the shell are next exposed to heat and smoke for three months，then broken，and the kernels thrown into a strong mixture of lime and water；after which they are cleaned and packed up．This process is necessary for their preservation，and with the same intention the mace is sprinkled with salt water．There are several varieties of the tree；but that denominated the queen nutmeg，which bears a small round nut，is the best．They are imported in chests，which contain each from 100 to 140 lbs ．weight；the mace comes in chests also of different sizes．The essential oil which is obtained in Banda by the distillation of the nut is brought

14068 Leaves somewhat orbicular cordate at base 7 -nerved or little downy, Fem. racemes the length of leaves 14069 Lvs. ovate bluntish smooth on short stalks, Racemes much branched, male? scarcely longer than petiole

14070 Monœcious diandrous, Leaves oblong serrated
14071 Leaves oblong downy serrated
14072 Leaves obovate entire
14073 Leaves oblong blunt entire fascicled, Spines axillary
14074 Leaves cordate glandular or the limb
14075 Leaves oblong acuminate smooth, Veins simple, Fruit solitary smooth
14076 Leaves oblong lanceolate with starry down beneath, Veins simple, Fruit racemose downy
14077 Leaves sessile, Pitchers cylindrical, Flowers panicled
14078 Leaves sessile linear lanceolate acute, Flowers axillary solitary
14079 Leaves sessile obovate acute, Peduncles about 3-fl. axillary
14080 Leaves subsessile lanceolate obovate, Flowers axillary solitary
14081 Leaves subsessile linear-lanceolate acute thickish, Flowers axillary twin
14082 Leaves stalked linear blunt mucronate revolute at edge, Flowers axillary subsolitary on long stalks
14083 I eaves elliptical blunt densely downy on each side, Flowers axillary solitary sessile
14084 Leaves stalked ovate acute smooth, Flowers in 5s axillary
14085 Leaves stalked elliptical blunt somewhat retuse smooth shining, Flowers axillary polygamous about 3

14080
14085

and Miscellaneous Particulars.
in bottles, and the expressed oil in stone jars. Nutmegs are frequently punctured and boiled in order to obtain the essential oil, and the orifices afterwards closed with powdered sassafras. The fraud is detected by the lightness of the nutmeg. The nutmeg has a fragrant, agreeable, spicy odor, and a warm aromatic taste.
As the medical properties of nutmeg and mace depend on the essential oil they contain, they agree in these circumstances; and both are stimulant, carminative, and, in large doses, narcotic. Mace is more generally used as a culinary spice; but the nutmeg and its volatile oil are in frequent use to cover the disagreeable taste of other medicines, and are sometimes ordered in cases of languor, vomiting, and diarrhœea, and in flatulent colic. On account of the narcotic property of the oil, nutmeg should be cautiously employed in apoplectic and paralytic habits. In India its dangerous effects have been frequently felt; and in this country instances have occurred in which the nutmeg, taken in large quantity, produced drowsiness, great stupor, and insensibility, and on awakening delirium, which alternated with sleep for several hours. (Thom. Lond. Disp. p. S95.)
M. fatua is a branching lofty tree; the branches long, tortuous and declining; the leafy and flowering branches downy and ferruginous ; and the flowers in axillary and terminal clusters. The fruit varies in size and form on different trees; but is generally oblong, and about as long as a pigeon's egg. From the kernel is extracted a species of yellowish suet or fat, which serves for various medical and economical purposes, and is made into candles. From the wounded bark flows a red acrid juice. The plants are at present rare in British collections: they grow in light loam and peat, and may be increased by cuttings in sand under a bell-glass.
2121. Nepenthes. The name under which Homer speaks of a substance, which appears to have been opium. It is impossible to conceive in what sense the word has been applied to the plants now bearing the name. They are the famous pitcher-plants of China and the East Indies, which bear leaves, the extremities of which are hollowed out into cup-like appendages, which are generally filled with water, which seems as if confined within them by a little lid, by which the pitchers are surmounted. The cultivation of the plants is extremely difficult. It requires a very damp atmosphere, much heat, and perhaps, not much light. They are managed more successfully by Loddiges of Hackney, than by any cultivators in this country.
2122. Cluytia. Named by Boerhaave, after Outgers Cluyt, or Augier Clutius, a Dutchman, and professor of botany at Leyden. He published, in 1634, a little tract upon the Cocoa-nut of the Maldives, which he called nux-medica. The species are of little beauty or interest, and of the easiest propagation and culture.

\section*{Class XXIII. - POLYGAMA.}

\section*{Flowers either male, female, or hermaphrodite, upon the same or different plants.}

This class differs from the two preceding in having not only the sexes in different flowers upon the same individual as in Moncecia, or upon separate individuals as in Diœecia, but also combined in one flower, mixed among those which are unisexual. It may, therefore, be considered to contain those genera which are in a state of transition from the common hermaphrodite structure to absolute unisexuality.

To the first of its orders are referred several grasses, which are excluded from the early classes on account of the separation of their sexes; it also contains the numerous tribe of Mimosas, so well known for their various properties as objects of food, of ornament, of medicine, or of curiosity. The maple is also stationed in the first class, as are a few genera of palms.
The most important genera of the second class, besides the poetical Palmetto, are the ash and the fig. Gleditschia and Ceratonia, two families of Leguminosæ, are valuable, the former for its light, airy, elegant foliage, and the latter for its sweet pods, which are used in Spain, in great quantities, as fodder for cattle.

Order 1. MONCECIA.

Flowers monœcious.
2123. Inga. Hermaphrodite. Cal. 5-toothed. Cor, tubular, 5-fid. Stam. 100, monadelphous. Pod 2-valved, Seeds enwrapped in pulp, or in an arillus. Male. Cal, 5-toothed. Cor, tubular, 5-fid. Stam. 100, monadelphous.
2124. Mimosa. Hermaphrodite. Cal. 5-toothed. Cer. O. or 5-toothed. Stam. 8. Pod separating into oneseeded joints. Male. Cal. 5-toothed. Cor. O. or 5 -toothed. Stamens 8.
2125. Schrankia. Hermaphrodite. Cal. 5-toothed. Cor. 5-fid. Stamens 8-10. Pod 4-valved. Male. Cal. 5-toothed. Cor. 5-fid. Stamens 8-10.
2126. Desmanthus. Hermaphrodite. Cal. 5-toothed. Cor. 5 petals. Stamens 20. Pod 2 -valved. Male. Cal. 5-toothed. Cor. O. Stamens 20.
2127. Acacia. Hermaphrodite. Cal 5-toothed. Cor. 5-fid. Stamens 4-100. Pod 2-valved. Male. Cal. 5 -toothed. Cor. 5 -fid. Stamens 4-100.
2128. Veratrum. Hermaphrodite. Cal. O. Cor, 6-petalous, Stamens 6. Ovaries 3. Caps. 3, manyseeded. Male. Same as hermaphrodite, but no ovary,
2129. Andropogon. Hermaphrodite. Cal. 1-f. Palea glume bearded, either at base or tip. Stamens 3. Styles 2. Seed 1. Male, Ovary none.
2130. Chloris. Flowers 1-sided. Cal. 2-valved, with 2 or 6 florets: one sessile, hermaphrodite; the other stalked, male. Hermaphrodite. Paleæ with a terminal beard. Stamens 3. Styles 2. Seed 1. Male. Cal. O, Palea one or two, bearded. Stamens 3 .
2131. Sorghum. Flowers panicled. Glume coriaceous-cartilaginous, 2-Aowered closed. Paleæ of the hermaphrodite bearded; of the neuter single, beardless. Male. Glume 1-f. stalked. Paleæ 2, beardless.
2132. Holcus. Hermaphrodite. Cal. glume 1-2-flowered. Paleæ bearded under the end. Stamens 3. Styles 2. Seed 1. Male, Cal. glume 2-valved. Paleæ O. or 2. Stamens 3.
2133. Ischemum. Hermaphrodite. Cal. glume 2-flowered. Paleæ 2. Stamens 3. Styles 2. Seed1. Male Cal. and palea as in hermaphrodite. Stamens 3.
2134 . Egilops. Hermaphrodite. Cal. glume about 3-fowered, cartilaginous. Palea terminated by a triple beard. Stamens 3. Styles 2. Seed 1. Male. Cal. and pal, of hermaphrodite. Stamens 3.
2135. Manisuris. Hermaphrodite. Glume 1-fl. Paleæ 2. Stamens 3. Style bifid. Male. Glume 1-f.

Paleæ 2. Stam. 3. All the valves of calyx emarginate at end and sides.
2136. Valantia. Hermaphrodite. Cal. O. Cor. 4-parted. Stamens 4. Style 2-fid. Seed 1. Male. Cal. O. Cor. 3-4-parted. Styles 3-4.
2137. Parietaria. Hermaphrodite. Cal. 4-fid. Cor. O. Stam. 4. Style 1. Seed 1. Female. Cal. 4-fid. Cor. O. Style 1. Seed 1.
2138. Atriplex. Perfect f. Perianth. single, 5-partite, inferior. Stam. 5. Style bipartite. Fruit depressed, 1-seeded, covered by the cal. Pistilliferous f., Perianth. single, 2 -partite. Stam. O. The rest as in the perfect flower.
2139. Rhagodia. Hermaphrodite. Cal. 5-parted. Cor. O. Stamens 5 , or fewer. Acinus depressed. Male. Cal., cor., and stam. of the hermaphrodite.
2140. Terminalia. Hermaphrodite. Cal. 5-parted. Cor. O. Stam. 10. Drupe inferior. Male. Cal. fiveparted. Cor. O. Stamens 10.
2141. Fusanus. Hermaphrodite. Cal. 5 -fid. Cor. O. Stamens 4. Ovary inferior. Stigma 4. A drupe. Male. Fruit abortive. Cal., cor, and stam. of hermaphrodite.
2142. Brabejum, Hermaphrodite. Cor. of catkin 4-parted. Stamens 4. Style2-fid. Drupe with a fleshy round nut. Male. Cor. of catkin 4-parted. Stamens 4. Style 2-fid, abortive.
2143. Acer. Hermaphrodite. Cal. E-fid. Cor. 5 petals. Stamens 8 . Styles 2. Samara winged at end, oneseeded. Male. CaL 5.fid. Cor, 5 petals. Stamens 8 .
2144. Negundium. Cal very small, unequally 4-5-tonthed. Pet. O. Male. Flowers fascicled, Anthers 4.5, linear, sessile. Female. Flowers racemose.
2145. Celtis. Hermaphrodite. Cal. 5-parted. Cor. O. Stamens 5. Styles 2. A drupe. Male. Cal, six-
parted. Cor. O. Stamens 6.
2146. Gouania. Hermaphrodite. Cal. 5-fid, superior. Cor. O. Stamens 5. Style 3-fid. Fruit 3-cornered, 3-parted. Male. Cal. 5-fid. Cor. O. Stamens 5.
2147. Hermas. Hermaphrodite. An umbel. Cor. 5 petals. Stamens 5, sterile. Male. An umbel. Cor. 5 petals. Stamens 5, fertile. Styles 2. Seeds 2 , inferior, cordate, orbicular.
2148. Bridelia. Hermaphrodite. Cal. 5-parted. Petals 5, inserted in calyx. Stamens 5, monadelphous. Styles 2, bifid. Berry 2-seeded. Male. Cal. 5-parted. Petals 5, inserted in the calyx. Filam. columnar, bearing 5 anthers. Female. Cal, and corolla of male. Styles 2, bifid. Berry 2-seeded.
2149. Feronia. Hermaphrodite. Cal. 5 -toothed. Cor. 5 petals. Stamens 10 . Style 1. Berry 5 -celled, many-seeded. Male. Cal. 5-toothed. Cor. 5 petals. Stamens 10.
2150. Ailantus. Hermaphrodite. Cal. 5-parted. Cor. 5 petals. Stamens 2-3. Ovaria 3-5. Styles lateral. Samaras 1-seeded. Male. Cal. 5-parted. Cor. 5 petals. Stamens 10 . Female. Cal, 5 -parted. Cor, 5 petals. Ovaries 3-5. Styles lateral. Samaras 1 -sceded,
2151. Clusia. Hermaphrodite. Cal. 6-leaved. Cor. 4-6 petals. Anthers clustered. Stigmas 4-6. Caps. a-celled, many-seeded. Male. Cal. 4-G-leaved. Cor. 6 petals. Stamens numerous.
2152. Ophioxylon. Hermaphrodite. Cal. 5-fid. Cor. 5-fid. Stamens 3. Ovary 1. Male. Cal. 2fid. Cor. 5-fid. Stamens 2.
2153. Rhapis, Hermaphrodite, Cal, S-fid. Cor. S-fid. Stamens 6. Ovary 1. Drupe 1-secded. Male Cal. 3-fid. Cor. 3-fid. Stamens 6.

Order 2. DICECIA.

Flowers diœcious.
2154, Gleditschia. Hermaphrodite. Cal. 4-fid. Cor. 4 petals. Stamens 6. A pod. Male. Cal. 3-leaved. Petals 3. Stamens 6. Female. Cal. 5-leaved. Petals 5. A pod.
2155. Ceratonia. Hermaphrodite. Cal. 5-parted. Cor. O. Stamens 5. Style 1. Pod coriaccous, manyseeded. Male. Cal. 5-parted. Cor. O. Stamens 5. Female. Cal. about 5-toothed. Cor, O. Style 1. Pod coriaceous, many-seeded.
2156. Fraxinus. Hermaphrodite. Cal. O. or 4-parted. Cor, O. or 4 petals. Stamens 2. Samara 1-seeded. Female. Cal. O. or 4 -parted. Cor. O, or 4 petals. Samara 1 -seeded.
2157. Brosimum. Hermaphrodite. Catkin globose, with a solitary ovary at end. Cal, a scale. Cor. 0 .

Anthers peltate, solitary. Style 2fid. Female. Cal. O. Cor. O. Ovary imbricated with scales. Style 2fid. Berry coated, 1 -seeded.
2158. Diospyrus. Hermaphrodite. Cal. and cor, 4-fid, Stam. 8., Style 4-fid. Berry 8-seeded, Male. Cal. and cor. 4 -fid. Stamens 8.
2159. Myrsine. Cor. half 5 -cleft, conniving. Ovary flling the corolla. Drupe 1-seeded. Nut 5-celled,
2160. Nyssa. Hermaphrodite. Cal. 5-parted. Cor. O. Stamens 5. Ovary 1. Drupe inferior, Male. Cal. 5-parted. Cor, O. Stam. 10.
2161. Hamiltonia. Hermaphrodite. Cal. 5-fid. Cor. O. Nect. a 5-toothed disk. Stamens 5. Ovary 1. Drupe inferior. Male. Cal. 5-fid. Cor, O. Nect. a 5-toothed disk. Stamens 5.
2162. Laurophyllus. Hermaphrodite. Cal. 4-leaved. Cor. O. Stamens 4. Ovary superior. Style 1. Male. Cal. 4-leaved. Cor. O. Stamens 4.
2163. Bursera. Hermaphrodite. Cal. 5-toothed. Petals 5. Stamens 10. Style O. Caps. 3-valved, oneseeded. Male. Cal. 5-toothed. Petals 5. Stamens 10.
2164. Arctopus. Male. An umbel. Petals and stamens 5. Hermaphrodite. An umbel. Petals 5. Styles 2. Seeds 2. Involucre very large.
2165. Panax. Herımaphrodite. An umbel. Cal, E-fid. Petals 5. Stamens 5. Styles 2. Berry 2-seeded.

Male. An umbel. Cal. entire. Petals 5. Stamens 5.
2166. Ficus. Common receptacle turbinate, closed, fleshy. Female. Cal, 5-parted. Cor. O. Ovary 1. Sced 1. Male. Cal. 3-parted. Cor. O. Stamens 3.

Leguminosa. Sp. 12-71.
2125. SCHRANK'IA, W. Schrankia.

History, Use, Propagation, Culture,
2123. Inga. This is an American name adopted by Marcgraaf. A fine genus of plants, remarkable for their beautiful foliage and flowers; but in cultivation they seldom blossom. I. purpurea is a remarkably elegant plant, and so is Inga biglobosa. 1. unguis-Cati, the Cat's claw, Mimosa, is so called from the form of its curved spines. All the species require the greatest heat of the bark stove; they increase very slowly by cuttings.
2124. Mimosa. Said to be derived from \(\mu\) нرs, a buffoon, because the leaves of the sensitive species appear as if to play with the hand that touches them.

The cause of the well known motion in the leaves of the sensitive plant, has been the subject of many ingenious explanations; but it has not been treated by any botanist with so much ingenuity and address as by Dr. Dutrochet, whose theory we give, as explained by Mr. Lindley in the Botanical Register. M. Dutrochet state8, that having ascertained hot nitric acid to possess the power of separating and reducing to its simplest form the whole mass of vegetable tissue, and that the action of the same acid produced other effects equally advantageous for the examination of the most obscure parts of vegetable structure, he was induced to give his attention to that of the Mimosa pudica, in the hope of gaining some evidence respecting the cause to which its sensibility is to be ascribed. Beginning with the pith, he observed a considerable number of minute globules of a greenish color, intermingled among the cells, and adhering to them in an irregular manner. After attempting to shew the probability of these globules having deceived M. Mirbel in various points of his analysis of vegetation, and especially in regard to the pores, which that botanist supposes to exist in the cellular tissue of plants, Dr. Dutrochet proceeds to remark, that the application of hot nitric acid to these globules renders them perfectly opaque, whence he concludes, that they are, in fact, minute cells filled with a particular fluid, which is subject to become concrete by the application of acids. Now, it is known, that such fluids as are thus altered by acids, are usually dissolved and liquefied again by the application of alkalies. A few drops, therefore, of a solution of hydrate of potash were suffered to fall upon a portion of the pith on which nitric acid had been acting, and the mixture was exposed to the heat of a lamp. Being examined after a few minutes, the globules were found to have resumed their natural appearance. This curious fact indicated, in the opinion of Dr. Dutrochet, a strong and unexpected point of analogy between plants and animals. According to the microscopical researches of some modern observers, it has been ascertained that all the organs of animals are composed of a conglomeration of minute corpuscles, similar to those just described; the corpuscles which constitute the muscles are soluble in acids, but those which compose the nervous system are insoluble in the same acids, and only soluble in alkalies. Now, as the chemical properties and the external appearance of the particles scattered among the cellular tissue of plants, and constituting the nervous system of animals, are the same, the author is induced to inter, that the spherical particles of plants are, in fact, the

and Miscellaneous Particulars.
scattered elements of their nervous system. This bypothesis receives additional strength from the great similarity which exists between the medullary substance of the brain of Mollusca Gasteropoda and the cellular medullary tissue of plants. In pursuit of this idea, Dr. Dutrochet made a variety of experiments upon the sensitive plant, the results of which seem to be these. - The principal point of locomotion, or of mobility, exists in the little swelling which is situated at the base of the common and partial petioles of the leaves; this swelling is composed of a very delicate cellular tissue, in which is found an immense number of nervous corpuscles; the axis of the swelling is formed of a little fascicle of tubular vessels. It was ascertained by some delicate experiments, that the power of movement, or of contraction and expansion, exists in the parenchyma and cellular tissue of the swelling, and that the central fibres have no specific action connected with the motion. It also appeared that the energy of the nervous powers of the leaf depended wholly upon an abundance of sap, and that a diminution of that flud occasioned an extreme diminution of the sensibility of the leaves. Prosecuting his remarks yet further, the author ascertained, that in the motion of the sensitive plant, two distinct actions take place, the one of locomotion, which is the consequence of direct violence offered to the leaves, and which occurs in the swellings already spoken of; the other of nervimotion, which depends upon some stimulus applied to the surface of the leaflets, unaccompanied by actual violence, such as the solar rays concentrated in the focus of a lens. As in all cases, the bending or folding of the leaves evidentiy takes place from one leaf to another with perfect continuity; it may safely be inferred, that the invisible nervous action takes place in a direct line from the point of original irritation, and that the cause by which this action of nervimotion is produced, must be some internal uninterrupted agency. This was, after much curious investigation, determined by the author to exist neither in the pith, nor in the bark, nor even in the cellular tissue filled with nervous corpuscles, and on which, he supposes, the locomotion of the swelling at the base of petioles to depend. It is in the ligneous part of the central system, in certain tubes supplied with nervous corpuscles, and serving for the transmission of the sap, that Dr. Dutrochet believes he has found the true seat of nervimotion, which he attributes to the agency of the sap alone, while he considers the power of locomotion to depend upon the nervous corpuscles alone.

Some of the species ripen seed; others may be increased by cuttings from the points of the young shoots planted in sand and kept closely covered.
The pods of M. fagitolia contain a sweet whitish pulp, which the natives of Martinique suck; they call the tree and its fruit Pois Doux, or sweet pea,

History, Use, Propagation, Culture,
3126. Desmanthus. From \(\delta \varepsilon \sigma \mu n\), a bond, and ay. 0 os, a flower, on account of the fascicles of flowers, which seem as if bound up together. These plants are chiefly aquatic; a few are prickly; and they all have the habit of Mimosa. D. natans is used in China as a pot-herb; and is described by Loureiro, under the name of Neptunia oleracea. Willdenow, the author of the genus, observes, that the neuter florets have always a different color from that of the hermaphrodites, whence the spikes appear parti-colored, by which character the genus may be known at a distance. Culture as in Mimosa, D. natans should be grown in water.
2127. Acacia. This was the Greek name of some plant of the present genus, and not being appropriated, was taken by Willdenow, in his reformation of the old genus Mimosa, as the designation of one of his new divisions. This is one of the most ornamental families of the greenhouse plants, and some are curious as well as beautiful. A. Julibrissin, the Gul ebruschim, or rose of silk of the Persians, and the Gazia of Italian gardeners, is an elegant hardy tree with beautiful tufts of pink colored flowers, which resemble tassels of silken threads.
A. Catechu and vera are used in medicine. The inner wood of the former tree is of a brown color, from which the catechu is thus prepared. "After felling the trees, the manufacturer carefully cuts off all the exterior white part of the wood. The interior colored part is cut into chips, with which he fills a narrowmouthed unglazed earthen pot, pouring water upon them until he sees it among the upper chips; and when

and Miscellaneous Particulars.
this is half evaporated by boiling, the decoction, without straining, is poured into a flat earthen pot, boiled to one-third part, and then set in a place to cool for one dav. The decoction is afterwards evaporated by the heat of the sun, stirring it several times in the day; and when it is reduced to a considerable thickness, it is spread upon a mat or cloth, which has previously been covered with the ashes of cowdung. The mass is lastly divided into square or quadrangular pieces by a string, and completely dried by turning them in the sum, until they are fit for sale. This extract, when first introducd as a medicine into Europe, was named Terra Japonica, from the supposition that it came from Japan and was an earth."
Medicinally catechu is one of the most valuable of the vegetable astringents; and as the dark colored contains the greater quantity of tannin, on which its astringency depends, it is to be preferred for medicinal use. It is employed with the best effects in dysentery and diarrhcea, when the use of astringents is admissible; in alvine and uterine hæmorrhages, leucorrhœa, gleet, and in obstinate catarrhal affections. As a local astringent, it is used in sponginess of the gums, and aphthous ulcerations of the mouth and fauces, and we have found the slow solution of a small piece of it in the mouth, a certain remedy for the troublesome cough induced by a relaxed uvula hanging into and irritating the glottis. Dr. Paris recommends it as a dentifrice, especially when the gums are spongy.
A, vera produces the gum arabic of the shops. The tree is found in almost every part of Africa, but those

History, Use, Propagation, Culture,
which yield the gum which is exported from Barbary to Great Britain, grow principally in the Atlas mountains. It is a hard withered looking low tree, with a crooked stem, and a grey bark. The gum exudes naturally from the bark of the trunk and the branches, in a soft, nearly fluid state, and hardens in the air without losing its transparency. It is collected about the middle of December. It has a faint smell when first stowed in the warehouses, and is heard to crack spontaneously for many weeks.
Medicinally gum exerts no action on the living system, but is a simple demulcent, serving to lubricate abraded surfaces, and involve acrid matters in the primæ viæ. In the solid form it is scarcely ever given, unless to sheath the fauces, and allay the tickling irritation which occasions the cough in catarrh and phthisis pulmonalis; in which cases a piece of it is allowed to dissolve slowly in the mouth. It is chiefy used in a state of mucilage.
According to Sweet, all the species of Acacia are of easy culture. Those of the hothouse he recommends to be grown in loam and peat. "Cuttings," he says, " of most kinds will strike root. From the strongest growing kinds, take off large cuttings at a joint, and plunge them in a pot of sand under a hand-glass in the bark-bed.

14203 Racemes panicled, Bractes of branches oblong: partial as long as downy peduncle, Flowers exect 14204 Racemes panicied, Bractes of branches oblong-lanceolate : partial longer than downy petiole

and Miscellaneous Particulars.
Of the smaller kinds take younger cuttings, and put them under a bell-glass, also plunged in heat. The sooner the plants are potted off after they are rooted the better. If they stay too long, the sand injures their roots : they should be kept under a close glass, and shaded for a few days after potting off, and exposed to the air by degrees." (Bot. Cult. 11.)

The greenhouse species are particularly valuable as flowering for the most part in winter, or early in spring ; they are very hardy and grow freely in loam, peat, and sand well drained. Cuttings of most kinds, Sweet observes, will root pretty freely, taken off in the young wood and planted in sand, under a hell-glass, and plunged in a little bottom heat. The kinds that do not root readily from cuttings may be increased by taking off roots, as large pieces as can be spared, and planting them in the same kind of soil as the old plants, when they should be plunged under a hand-glass in a little bottom heat. Most of the kinds might be propagated by that means. (Bot. Cult. 126.)
2128. Veratrum. Said by Lemery to be so called, because its root is vere-atrum, truly black. V. album has a fleshy fusiform root, beset with strong fibres, gathered into a head; this root and every part of the plant is

History，Use，Propagation，Culture，
extremely acrid and poisonous．It is used in medicine，and its properties are found to depend on veratrine， the same alkaline principle which is the active ingredient of colchicum．Medicinally it is violently cathartic and sternutatory．When taken internally，even in moderate doses，its operation is violent and dangerous； producing besides hypercatharsis，with bloody stools and excessive vomiting，great anxiety，tremors，vertigo， syncope，sinking of the pulse，cold sweats，and convulsions，terminating，if the dose be large，in death．Its external application to an ulcerated surface also produces griping and purging．Notwithstanding these effects， Veratrum has been exhibited internally，and with advantage，in mania，epilepsis，scabies，lepra，and obstinate herpetic eruptions．But the most ordinary use of white hellebore is as a local stimulant．When taken in－ ternally as a poison，the best antidote is a strong infusion of nut－galls．（Thom．Lond．Disp．p．545．）

V．nigrum is very nearly allied to album，but differs in color，and seems not to be so strong and acrid in its qualities；for when both sorts are placed near each other，snails will entirely devour the leaves of this species， when they will scarcely touch those of the other．

2129．Andropogon．From exyן，a man，and twy ary，a beard．A hyperbolical comparison of the little tuft of nairs upon the flower to the beard of a man．A．schænanthus has an agreeable smell，with a warm，bitterish， not unpleasant taste．It was formerly brought over from Turkey in bundles about a foot long，and kept in the shops to be employed as a stomachic and deobstruent，but it is now little used．All the species are of the easiest culture．

2130．Chloris．Derived from \(\chi^{\text {rapos，}}\) green，on account of the color of its herbage．Pretty little grasses， with beautiful one－sided spikes of sliky flowers．
2131．Sorghum．Sorghi is the Indian name，according to Bauhin．S．vulgare，grand millet，Fr．，Saggena or Sorgo，Ital．，and aicandia，Span．，is much cultivated in Arabia and most parts of Asia Minor．It has been introuuced into Italy，Spain，Switzerland，and some parts of Germany；also into China，Cochin－ China，and the West Indies，where it grows commonly five or six feet high or more，and being esteemed a hearty food for labourers，is called Negroe Guinea corn．Its long awns or bristles defend it from the birds． In England，the autumns are seldom dry and warm enough to ripen the seeds well in the field．In Arabia it is called Dora or Durra．The flour is very white，and they make good bread of it，or rather cakes，about two inches in thickness．The bread which they make of it in some parts of Italy is dark and coarse．In Tuscany it is used chiefly for feeding poultry and pigeons；sometimes for kine，swine，and horses．Brooms are made of the spikes，which are also sent to this country for the same purpose．The Indian millet，as well as the common sort（Panicum），is cultivated in some parts of North America，and has been tried in this country，but it is only in the warmest autumns that it ripens its seeds．It might probably，however，be acclimated．

and Miscellaneous Particulars.
2132. Holcus. From \(\dot{\varepsilon} \lambda x \omega\), to extiact. It was a popular notion among the ancients, that the leaves of the plant they called Holcus, which seems to have been a grass of some kind, had the property of extracting thorins from the flesh. H. mollis is distinguished by its creeping roots, which, when once in possession of the soil, as Mr. Sinclair observes, can hardly be again expelled without great labor and expence. It is the true couchgrass of light sandy soils, and underground stolones have been found five feet in length, the growth of a few months only. These root-shoots contain a very considerable quantity of nutritive matter, which has the flavor of new made meal. Pigs are very fond of the roots, and dig them up with eagerness; but the herb:ge is disliked by oattle, more than that of any other species of the genus, being extremely soft, dry, and tasteless. The best mode of banishing this weed from light arable lands, is to collect the roots with the fork after the plough. (Sinclair, Hort. Gram. 167.)
H. lanatus has a fibrous root, and grows on all soils from the richest to the poorest, but attains to the highest degree of luxuriance on light moist peaty soils. Cattle prefer almost any other grass to this; it is seen in pastures with full grown perfect leaves, while the grasses that surround it are cropped to the roots, Its nutritive matter consists entirely of mucilage and sugar ; while the nutritive matters of grasses most liked by cattle are either sub-acid or saline. Mr. Sinclair suggests, that this grass might probably be made more palatable to cattle, by being sprinkled over with salt. (Hort. Gram. 164,)
H. avenaceus, the Avena elatior of Linnæus, Curtis, and Host, is a bulky productive grass, eaten by horses, cattle, and sheep, but less nutritious than many other grasses. It pushes rapidly after being cropped; and though later in flowering than many other species, produces an early and plentiful supply of herbage in the spring. These properties would entitle it to rank high as a grass adapted for the alternate husbandry, but its nutritive matter contains too large a proportion of bitter extractive and saline matters to warrant its cultivation, without a considerable admixture of different grasses; and the same objection extends to its culture for permanent pasture. It is always present in the composition of the best natural pastures, and, as before mentioned, eaten in common with other grasses. It does not, however, constitute a large proportion of the herbage, but rather the least of any of the more valuable grasses that have been mentioned. (Hort. Gram. p. 171.) This grass and Triticum repens are the two species eaten by dogs to excite vomiting. One yariety has bulbous roots, and is a noxious weed in arable lands.
H. odoratus is one of the earliest flowering grasses; but it is tender, the spring produce of \(f_{i}\), rbage is inconsiderable, and its powerful creeping roots render it unfit for agricultural purposes. (Hort. Gram. 169.)
 the woolly seed which is borne by the Ischamum, if introduced into the nostrils, has the power of stopping the bleeding at the nose. Useless grasses.

14232 Spike ovate, Cal. all with 4 beards scabrous, Culms ascending
14233 Spike cylind. Lower cal. with 2 beards : the rest with 3, Beards of 2 terminal forets longer than the rest 14234 Spike cylindrical, Cal. with 1 beard, Cor. beardless, Terminal beards very long

13270 Branches diffuse, Leaves nearly opposite rhomboid-hastate entire smooth, Spikes terminal leafless

and Miscellaneous Particulars
the manner in which this is carried on, the flowers should be examined at a very early period of their expan. sion. The manner in which the stamens shed their pollen is curious. The filaments on their first appearance all bend inwards; as soon as the pollen is arrived at a proper state to be discharged, the warmth of the sun, or The least touch from the point of a pin will make them instantly fly back, and discharge a little cloud of dust. This process is best seen in a morning, when the sun shines on a plant in July or August: if the plant be large, numbers will be seen exploding at the same instant. Mr. Curtis remarks, that the same degree of cold (thirtyone Fahrenheit) which strips the mulberry of its leaves, will destroy the herbage of Parietaria, The ashes of the plant are said to contain a considerable quantity of nitre.
2138. Atriplex. The same name as Atraphaxis, which see. A. Halimus ( \(\dot{\alpha} \lambda, \mu o s\), maritime) grows on the sea-coast of the south of Europe, and in this country its silver-colored foliage adds to the variety of our shrubberies. A. portulacoides requires to be planted on a poor gravelly soil; in its native state it prefers the seashore and salt marshes. A. hortensis, sometimes called mountain spinach, was formerly cultivated as a culinary herb, and is still grown to a considerable extent in the neighbourhood of Paris, and the leaves gathered as spinach. There are several varieties more or less tinged with red or purple. The leaves of all the species may no doubt be used as pot-herbs.
2139. Rhagodia. From porwoivs, bearing berries. New Holland shrubs with alternate leaves, ard flowers growing in racemose spikes,

History, Use, Propagation, Culture,
2140. Terminalia. Because the leaves grow in bunches at the termination of the branches. The species grow in loam and peat, and ripened cuttings, with their leaves on, will root in sand closely covered.
2141. Fusanus. The ancient name of the Euonymus. This plant resembles it in foliage. A little Cape shrub, formerly included in Thesium.
2142. Brabejum. From \(\mathrm{G}_{\text {¢ }} \propto \varepsilon_{\varepsilon ь o v, ~ a ~ s c e p t r e . ~ T h e ~ e l e g a n t ~ r a c e m e s ~ o f ~ s p l e n d i d ~ f l o w e r s ~ m a y ~ w e l l ~ b e ~ c o m p a r e d ~}^{\text {a }}\) to a sceptre.
2143. Acer. A Latin word signifying vigorous or sharp. The wood was formerly manufactured into the heads of pikes and other weapons. The species consist of trees, most of them yielding a saccharine juice from the trunk, branches, and leaves. A. Pseudo-Platanus, Plane trce, Scot, grows wild in Switzerland, Germany, Austria, and Italy. It is remarkably hardy, and will grow with an erect stem, exposed to the highest winds, or to the sea-breeze. It is in leaf by the middle of April; and on their first appearance the leaves are of a pleasant green, but they exude a clammy juice so abundantly, that they attract a variety of insects, which soon perforate and disfigure them. The flowers of none of the species are of any beauty. The shade of the tree is said to do less damage to pasture than most trees. The timber was formerly much used by the turner, and is still in repute by the saddle-tree maker and the millwright. In spring and autumn, if the trunk be pierced, it yields abundance of juice, from which a good wine may be made, or sugar to a certain extent pro. cured by evaporation. A. rubrum grows in swamps in Pennsylvania, where the natives use it for almost all sorts of wood-work; with the bark they dye a dark blue, and make a good black ink. The Canadians tap the tree for the juice, of which they make sugar and treacle. The scarlet flowers of this species come out in spring before the leaves; they are without petals, and have not more than six stamens.

A saccharinum bears a considerable resemblance to A. platanoides, especially when young. From this tree, and probably also from other species, the inhabitants of North America make a very good sort of sugar. The trees are tapped in February, March, and April, during warm days and frosty nights. The incision is made with an axe or auger, or about two inches deep. A spout of sumach or elder is introduced, through which the sap Hows, from four to six weeks, into a trough, whence it is carried daily to a larger receiver; from which it is conveyed after heing strained to the boiler. The boiling and refining process is or should be carried on in the same manner with that for the cane sugar in the West Indies. A tree of an ordinary size yields in a good season from twenty to thirty gallons of sap, from which are made from five to six pounds of granulated sugar.
A. platanoides grows on the mountains of the northern counties of Europe, descending in some places of

and Miscellaneous Particulars.
Norway to the sea-shore. It abounds in the north of Poland and Lithuania, and is common through Germany, Switzerland, and Savoy. On a tolerable soil it attains a large size, and the leaves being smooth and of a shining green, as large or larger than those of the sycamore, and being seldom eaten or defaced, because the tree abounds in a sharp milky juice disliked by insects, they have a much better appearance than those of the sycamore; and in the spring, when the flowers are out, which are of a fine yellow color, this tree has great beauty. Hanbury observes, that in the autumn the leaves die to a golden yellow color, which produces a good effect at that season, when the different tints of the decaying vegetable world are displayed. He says further, that it is a quick growing tree, arrives at a great bulk, and is one of the best trees for sheltering habitations. Linnæus recommends it for sheltering walks and plantations; as yielding a juice from which sugar may be made, if it be wounded in the winter; and as cutting out into a white smooth wood, fit for the stocks of guns, the joiner and the turner. Dr. Hunter observes, that it is a quick grower, arrives at a great bulk, and answers all the purposes of the sycamore; the raising it for use, as well as ornament and variety, should not be neglected. (Mill. Gard. Dict.)
A. striatum has a slender stem, with a smooth bark beautifully varied with green and white stripes, the boughs of a shining red in winter. The thickness of the shade, the beauty of the bark, and the tree not being liable to insects, render it very desirable for ornamental plantations; the only objections to it are, that it is subject to be injured by storms, and that the abundance of its foliage and seeds occasions a great litter in autumn.
A. campestre forms a very picturesque little tree, and the timber is said to be far superior to that of the beech or the sycamore for the purposes of the turner. It is also frequently substituted for that of the holly and box by the mathematical instrument maker.
A. Opalus is a noble tree, with large and beautiful foliage, throwing an extensive shade; it is much prized in Italy for planting by avenues and public walks. All the species are easily raised from seed, though the ashleaved and some other species are occasionally propagated by layers and cuttings; the cuttings should be cut off at a joint, and, as in the case of most hardy trees and shrubs, they succeed best when planted in the autumn in a sheltered situation in the open ground.
2144. Negundium. A genus obviously distinguished from Acer by its pinnated leaves, A fine ornamental tree, called in North America black ash. There is another species in China,
2145. Celtis. One of the names anciently given to the Lotus. Tournefort first applied the name to the modern genus, which may be said to resemble both in fruit and foliage the shrubby Lotus of the ancients.

History，Use，Propagation，Culture，
C．australis，sometimes called the lote tree，is reckoned among the largest timber trees of the south of Europe． The wood is one of the hardest we are acquainted with；it is also very tough and flexible．In France，the forked branches are peeled，and cut so as to resemble rude hay－forks，and in that state used for various agricul－ tural purposes．The leaves have a cheerful light green color；the berries are the size of a small cherry，first yellow and then black；they are eaten by birds and children．
C．occidentalis bears a great resemblance to the first．The leaves come out late in the spring，but they are also the latest in fading of any of the deciduous sort；the timber is tough and pliable，and imported by coach－ makers for the frames of their carriages．It grows more freely in this country than the European species，and in some years bears abundance of fruit．
C．orientalis is a low－spreading tree or bush；the timber is white，and yields a gum like that of the cherry． C．aculeata is an inelegant little tree，with a drupe double the size of a pea，which is eaten by the natives of the Caribbee Islands and the neighbouring continent．All the species are easily increased by layers or seeds．
2146．Gouania．Antoine Gouan was professor of botany at Montpellier in the middle of the eighteenth century，and was a good botanist．The species are increased by ripened cuttings under a hand－glass in heat．
2147．Hermas．A name，the meaning of which is wholly unknown．An inconspicuous starved－looking plant of no known use；whence it is called depauperata．
2148．Bridelia．Named in honor of Professor Bridel，the celebrated muscologist．Small bushes or trees，with little beauty to recommend them．
2149．Feronia．Elegantly named by the classical Correa de Serra，after Feronia，the goddess of the forests． This is a noble Indian timber tree，bearing a fruit not unlike an orange，to which it is botanically related．
2150．Ailantus，Derived from Ailanto，the name of one species in the Moluccas．The usual way of writing it，Ailanthus，is therefore incorrect．A．glandulosa is a tree which may be compared to a gigantic stag＇s－horn sumach；it has very large leaves，unequally pinnate，with foot－stalks from one to two feet in length，and numer－ ous flowers in a terminating pedicel，which exhale a disagreeable odor．The tree grows very fast，and on very poor soil，especially if it be calcareous．If the bark be wounded，a resinous juice flows out，which hardens in a few days．The wood is hard，heavy，glossy like satin，and susceptible of a very fine polish．It is pro－ pagated by cuttings of the roots．In general the trees bear only male flowers；but in France it has produced both male and female flowers，and fruit twice in ten years．
2151．Clusia．So called，in honor of the celebrated Charles de l＇Ecluse，born at Artois in 1526，and died in 1609．He was one of the most excellent botanists who ever lived，and author of many works whose value will only cease with the world．But he is not more known for his mental excellence，than for his personal calamities，In his early youth he undertook to travel through Portugal，Spain，England，Hungary，and other countries in pursuit of plants；no easy task in those days．By excessive fatigue he contracted，so soon as in his twenty－fourth year，a dropsical complaint，of which he was afterwards cured with chicory by the celebrated

14301 Leaves broad ovate acuminate serrate smooth on each side
14302 Leaves ovate oblong acuminate serrulate unequally cordate at base rough above halry beneath
14303 Las. ovate obl. acum. equally cordate at base entire obsoletely serrated at end smooth, Branches prickly

14304 Leaves ovate acuminate bluntly serrated smooth
14305 Leaves cordate-ovate with glandular serratures roughish, Racemes terminal downy

14306 Stem downy, Leaves oblong sessile toothed downy beneath
14307 Leaves lanceolate ovate woolly above downy beneath entire

14308 Shrubby erect spiny, Leaves ovate entire acute glabrous

\section*{14309 The only species}

14310 Leaves pinnated with an odd one, Leaflets toothed at base, Teeth glandular 14311 Leaves abruptly pinnated, Leaflets serrated

14312 Leaves obovate blunt veinless, Cor, hexapetalous twice as large as calyx 14313 Leaves obovate blunt veinless, Cor \(5-7\) petalous half as large again as calyx 14314 Leaves obovate blunt veinless, Cor, 4-petalous twice as large as calyx 15315 Leaves obovate blunt veiny, Flowers tetrapetalous

14317 Fronds palmate plaited, Plaits and margins prickly
14318 Fronds simple 2-parted, Lobes acute plaited, Plaits roughish

and Miscellaneous Particulars.
Rondelet. See Rondeletia. At the age of thirty-nine he broke his right arm, during one of his botanical rambles; and a short time afterwards his right thigh. When fifty-five, he dislocated his left ancle while at Vienna; and eight years after his right hip. Having been unskilfully treated, he was ever after obliged to walk with crutches. The consequent deprivation of his natural exercise brought on other diseases, among not the least distressing of which were calculus and hernia. After having been the director of the Imperial Gardens of Vienna for fourteen years, he finally returned to his native country, Flanders. He was narned professor of botany at Leyden, where he gave botanical lectures for sixteen years, when he died overwhelmed by the multitude of his bodily infirmities, but retaining his faculties unimpaired to the last.
The species are trees abounding in a tenacious glutinous juice, of a balsamic flavor, whence the English name. C. rosea has handsome flowers, in which the stamina and pistillum are covered with a gelatinous gluten. The fruit is green and of the size of a middling apple, with eight lines running, like meridians on a globe, from the stalk to the crown of it- When it ripens, it opens at these lines, and divides into eight parts, disclosing many mucilaginous scarlet seeds, resembling those of the pomegranate. The whole tree is exceedingly beautiful, and the structure of the fruit is a most exquisite piece of mechanism. It grows on rocks, and frequently on the trunk and limbs of trees, occasioned by birds scattering or voiding the seeds, which being glutinous, like those of the misletoe, take root in the same manner; but the roots not finding sufficient nutriment, spread on the surface of the tree till they find a decayed hole, or other lodgment, wherein is some small portion of soil; the fertility of this being exhausted, a root is discharged out of the hole till it reaches the ground, where it fixes itself, and the stem becomes a large tree, Roots have been known to do this at forty feet from the surface. The resin is used to cure sores in horses, and instead of tallow for boats.
C. alba is an elegant tree, and epiphytical on other vast trees, like the foregoing; the trunk is frequently a foot in diameter, and supports a spreading head. The whole abounds in a balsamic juice, of a green color, but becoming of a brownish color on being exposed to the air. The flowers are white, and of no great beauty; the fruit scarlet, with a scarlet pulp; the birds are very fond of them, hang over them on the wing, and pluck out the seeds with the pulp adhering.
C. flava bears in all respects a considerable resemblance to the former. A very good idea of the progress of culture since Miller's time, may be formed by comparing his directions for propagating this plant, and those of Sweet. Mr. Miller says, the best way is to have them brought over in tubs from the West Indies: according to Sweet, the pots should be well drained, the soil for rooted plants should be a light sandy loam, and "cuttings root very freely in sand under a hand-glass."
2152. Ophioxylon. From oqus, serpent, and छvioy, wood. In Ceylon they employ the plant in cases of the bite of serpents. It grows freely in a mixture of loam and peat, and may be increased by cuttings in sand under a hand-glass.
2153. Rhapis. So named by Loureiro, from eacts, a needle, on account of the acute awns of the corolla, which stick into the clothes. Culture as in the other palms; that is, abundance of heat and room, both for the roots and top.

History, Use, Propagation, Culture,
2154. Chamarops. This word is said by etymologists to be synonymous with \(\chi \propto \mu \alpha i \delta \nu \varsigma\), or \(\chi \propto \mu \alpha s \delta \rho a r \dot{\psi}\), a dwarf oak. The modern genus consists of ormamental palms, which are fine hardy greenhouse plants.
2155. Gleditschia. Called in honor of John Gottlieb Gleditsch, a native of Leipzig, and member of the academy of Berlin, and the author of several works, among which his Arrangement of Fungi, published in 1753, and his Botanical System, are the most remarkable. G. triacanthos, the honey locust of North America, attains the size of a large tree, but very seldom flowers and ripens its seeds in this country. All the species grow in common garden soil, and are generally raised from seeds.
2156. Ceratonia. This name has been derived from \(x \varepsilon g a 5\), a horn, in allusion to the long horn-like pods of this plant, which contain a sweet foecula, for the sake of which they are often imported from Spain under the name of the Algaroba bean. This last word is a slight alteration, by the prefix of the article al, of the Arabic name of the tree, Kharroub, whence also our English name Carob-tree. This is generally considered the locust-tree of scripture ; and in Spain, where the seeds are eaten, it is called Saint John's bread. Ignorance of eastern manners and natural history, Professor Martin observes, induced some persons to fancy that the locusts on which John the Baptist fed, were the tender shoots of plants, and that the wild honey was the pulp of the pod of the Carob, whence it had the name of Saint John's bread. There is better reason to suppose, he adds, that the shells of the carob pod might be the husks which the prodigal son desired to partake

and Miscellaneous Particulars.
of with the swine. The tree is very common in the south of Spain, and the seeds or beans, as they were there called, often formed the principal food of the British cavalry horses during the war of 1811 and 1812. In our greenhouses the plant seldom flowers, but it grows very well in loam and peat, and ripened cuttings root in sand under a hand-glass.
2157. Fraxinus. The origin of this word is far from certain. Linnæus says, it has been taken from the Greek \(\varphi_{\rho} \xi_{5} \xi_{5}\), a separation, in allusion to the facility of splitting its wood. De Theis remarks, that M. A. Dureau de la Malle has proved, in a learned dissertation published in 1804, that the Fraxinus of the Latins and the Melia of the Greeks are our Ornus europæus, while the Ornus of the Latins and the Boumelia of the Greeks are, in fact, our Fraxinus excelsior, or common ash. Le Frêne, Fr., Esche, Ger., and Frassino, Ital. The English name is from the Celtic asc, a pike. F. excelsior is one of the most useful of our native timber trees, It is peculiarly adapted for implements of husbandry, and the coachmaker and wheeler; it makes excellent fuel, with very little smoke; good hop-poles and hoops, excellent handles for tools, and very good walking-sticks. Its period of leafing is very late, being seldom earlier than the last week of April, and not unfrequently about the middle of May: the leaves have been used to adulterate tea; they are bitter, and said to communicate a rank taste to the milk and butter of cows which eat them. The roots spread to a great extent, and lie very near the surface; and these, together with the shade of the head, are found very injurious to hedges and pastures. The variety of this species, \(\mathbf{F}\). pendula, was first discovered in a field at Gamblingay,

History，Use，Propagation，Culture，
in Cambridgeshire．There are other varieties with curled leaves，striped leaves，variegated bark，\＆c．and some consider \(F\) ．simplicifolia only a variety．F．Americana is a lofty tree，in few respects different from the common ash．Those species which do not produce seeds，are readily increased by grafting．
Little is known of the qualities of the greater part of the numerous varieties of American ash，distinguished by Bosc．They probably all form fine trees；the young plants in our gardens grow freely，and exhibit indi－ cations of valuable properties as ornamental trees．
2158．Brosimum．From \(\beta_{\rho} \omega \sigma \mu \nu \rho\) ，good to eat．B．Alicastrum is common in the woods of Jamaica．The timber is not despicable；but the leaves and younger branches are more useful，and a hearty fattening fodder for all sorts of cattle．The fruit，boiled with salt fish，pork，beef，or pickle，has been frequently the support of the negroes and poorer sort of white people in times of scarcity，and proved a wholesome，and not unpleasant food；when roasted，it eats something like our European chestnuts，and is called bread－nut．The leaves and younger shoots are full of gum，which renders them disagreeable to most cattic at first，but they soon grow very fond of them．
B．spurium is also common in woods in the West Indies，but its timber is of little value．In our stoves both species thrive well，and like loamy soil；and old cuttings，with their leaves on，root in sand in moist heat． 2159．Diospyros．From \(\Delta\) os \(\pi\) gegos，the fruit of Jove，or heavenly fruit．It has been fancied that the European species of this plant produced that famous fruit，which，according to ancient romancers，caused oblivion．D．Kaki is a valuable Japanese tree，which bears the fruit sometimes received from China in a dried form under the name of dates．D．discolor also bears a fine fruit．D．lotus produces fruit the size of a

and Miscellaneous Particulars.
cherry, yellow when ripe, sweet, and somewhat astringent; they are recommended as a cure for the diarrhœa. D. virginiana has a white brittle wood, covered with a dark brown bark. The fruit is in form and bigness like a date, very firm, like that fruit, and almost as sweet, with a large kernel.
2160. Myrsine. A Greek word synonymous with Myrtle. Modern botanists have applied the name to a genus of African myrtle-like shrubs. The species grow freely in loam and peat, and are increased by young cuttings in sand under a hand-glass.
2161. Nyssa. A name of a nymph, according to Linnæus. The species are large shrubs, which grow freely in any soil or situation, but prefer moisture. N. denticulata grows naturally in wet swamps in Carolina and Florida, and rises there to the height of eighty or hundred feet. Marshall, in his American Grove, describes it as a tree of great singularity and beauty. It produces fruit about the size and shape of small olives, which are preserved like them by the French inhabitants of the Mississipi, where it greatly abounds, and is called the olive-tree. The timber is white and soft when unseasoned, but light and compact when dry, which renders it very proper for the carver and turner. All the species are readily propagated by layers or seeds.
2162. Hamiltonia. Dedicated by Muhlenburg, to Mr. Hamilton, an American botanist. A shrub growing to the height of from three to six feet. The flowers grow in terminal racemes from an inch to an inch and a half long.
2163. Laurophyllus. An hybrid name created by Thunberg, to express the resemblance of the leaves, ¢u \(\lambda \lambda \alpha\), to a laurel. A shrub with stalked, oblong, acute, serrated, coriaceous leaves, and minute flowers growing in panicles three or four inches long.

2164. Bursera. So called after Joachim Burser, a disciple and friend of Caspar Bauhin, and professor of botany at Sara, in Naples. He is said to have left behind him an Herbarium, in twenty-five volumes. B. gummifera is a large tree with a fine leafy head, and abounds in copious watery balsamic fluid, which soon becomes inspissated by exposure to the air. The root is said to possess the same properties as Quassia. Hedges are made of it by the Spanish residents in South America, who call it Almacigo.
2165. Arctopus. Literally, bear's foot, «¢\% \begin{tabular}{c} 
\\

\end{tabular} are used with success at the Cape, in cases of siphilis; but upon trial here some years since, they were found to be less efficient than Sarsaparilla.
2166. Panar. A high-sounding title, meaning little less than that the plant which bears it is the long sought universal elixir; the name has been taken from \(\pi \alpha y\), and \(\propto x o 5\), a remedy; a remedy for all things. P . quinquefolium is a native of Chinese Tartary, and also of North Anaerica. In the former country it has been gathered as an invaluable drug from time immemorial. The roots, which are said to bear some resemblance to the human form, are gathered and dried, and enter into almost every medicine used by the Tartars and Chinese. Osbeck says, that he never looked into the apothecaries' shops, but they were always selling Ginseng, that both poor people and those of the bighest rank made use of it, and that they boil half an ounce in their

tea or soup every morming, as a remedy for consumption and other cuseases. Jartoux relates, that the most eminent physicians of China have written volumes on the medicinal powers of this plant, asserting that it gives immediate relief in extreme fatigue, either of body or mind, that it dissolves pituitous humours, and renders respiration easy, strengthens the stomach, promotes appetite, stops vomiting, removes hysterical, hypochondriacal, and all nervous affections, giving a vigorous tone of body even in extreme old age. The French in Canada use this root for curing the asthma, and as a stomachic. After all, our physicians say, that we have no proofs of the efficacy of Ginseng in Europe, and that from its sensible qualities it seems to possess very little power as a medicine. The hardy species thrive well in light rich soil; the others grow in loam and peat, and are increased by cuttings in sand under a hand-glass
2167. Ficus. It is not known what the derivation of this word is; but in most languages it is nearly the same. In Greek it is \(\sigma \nu z \eta\), in Latin Ficus, in Celtic Figuczen, in Teutonic feige, in Sclavonic fige, in Hungarian fwge, in Anglo-Saxon fic. The species are trees or shrubs, abounding in a milky juica The fruit is turbinate, feshy, soft, and hollow within. All the species are natives of warm countries. F. Carica, le fguier, Fr., Fcigenbaum, Ger, and Fico, Ital., is supposed to be originally from Caria, in Asia, though it is now acclimatized, and in some respects naturalized in the Levant and

the south of Europe. In these countries the fruit green and dried forms an important part of the food of the inhabitants. In this country it is cultivated as a fruit tree, but not generally or extensively. It is only in very warm situations that it will ripen its fruit in the open air, even though trained against a wall; though there are one or two exceptions in Sussex on the sea-coast, where it ripens its fruit on standards. The only certain mode, however, is to grow it in houses built on purpose. No tree is more robust or more prolific. Even plants in pots or tubs kept in a temperature adapted for the orange-tree will fruit freely, and ripen two crops a year. Kept in the temperature of the pine-apple, Mr. Knight has proved, that the fig will go on growing and ripening fruit without intermission. A variety of curious and important matter respecting this tree will be found in the Transactions of the Horticultural Society, and in the Encylo.

\section*{Class XXIV. - CRYPTOGAMIA.}

\section*{Sexual organs hidden; either imperfect, or not existing.}

Thrs class differs essentially from all the preceding in the peculiar conformation of the organs of reproduction, which are not formed of male and female parts, like those of the higher classes of plants, but are of a nature altogether different, consisting either of buds under a particular form, or of vessels containing vegetable substances analogous to seeds, but differing in not being the result of impregnation, and in having the power of striking root indifferently from any point of their surface. The internal composition of these vegetable substances, which are denominated sporules, is, on account of their extreme minuteness, unknown. Willdenow describes Cryptogamous plants to be vegetables without any visible flower, and differing from other plants in their external characters, in which respect they also differ from each other. By more modern botanists they are said to be distinguished from other plants by the absence of lymphatic vessels, and of pores of the epidermis; but the latter character has been disputed, and neither apply to the three first orders of Cryptogamia. For the purposes of this work, which follows the system of Linnæus, the definition, if it can be so called, of Willdenow is most applicable. In the arrangement of the orders of Cryptogamia, it has been found advisable to adhere to the divisions of modern writers, who, by extensive observations, and great powers of perception, have brought this most abstruse part of botany to a considerable degree of perfection.

The orders which are here adopted, are
I. Filices. Reproductive organs uniform. Thecæ naked, or covered by an involucre, placed on the back of a frond, which is either foliaceous, or contracted in such a way as only to cover the clusters of thecæ, and always circinate when young.
II. Equisetacee. Reproductive organs uniform, in terminal spikes, composed of peltate, several-sided scales, producing on their under surface 4-7 elongated involucres containing the seeds. Branches whorled, rigid.
III. Lycopodinex. Reproductive organs axillary, sometimes apparently spiked. Thecæ? of two kinds, the one containing granules, the other larger bodies. Stems covered with many small leaves.
IV. Marsileacee. Reproductive organs radical, uniform. Sporules? contained in roundish, one or manycelled indehiscent heads. Plants simple, aquatic.
V. Muscr. Reproductive organs of two kinds. Thecæ many-seeded, solitary, furnished with an operculum and columella. Plants leafy.
VI. Hepatice. Reproductive organs of two kinds. 1st. Thecæ without an operculum, either naked or sessile, or furnished with a veil, through which they are, more or less, protruded. Sporules naked, or mixed with spiral threads. 2d. Minute, roundish, or oblong bodies variously situated. Plants frondose, of a cellular structure, not submersed.
VII. Alge. Reproductive organs of two kinds. 1st. Thecæ or tubercles variously situated. 2d. Sporules or granules naked, or immersed in the frond, Plants always aquatic, and submersed.
VIII. Lichenes. Reproductive organs uniform. Sporules deposited in receptacles of various forms, distinct in substance from the thallus, which is either pulverulent, crustaceous, membranous, foliaceous, or branched and shrub-like.
IX. Fungir. Reproductive organs uniform. Sporules arranged in tubular cells, placed in some part of the external surface. Substance various, mostly thick and fleshy, sometimes vesicular. Thallus none.

A few other divisions, such as Hypoxyla, \&c., which have been proposed by some writers of authority, nct having appeared to possess characters of sufficient importance, are here merged in others.
In consequence of the wide difference which exists between the lower orders of vegetables and the higher, and the impossibility of subjecting the former to cultivation, it has been found requisite, with the exception

14437 Leaves oblong acute subcordate at base netted beneath
14438 Leaves ovate unequal-sided sinuate-toothed cordate at base rough on each side
14439 Leaves opp. obovate oblong serrated acute scabrous above hairy beneath
14440 Leaves oblong acuminate blunt tapered at base netted beneath, Stipules scarious smooth 14441 Leaves ovate-oblong acute sinuate toothed smooth

\section*{and Miscellaneous Particulars.}
pxdıa of Gardening. ( \(\$ 5268\).) F. elastica as well as some other plants produce the gum known as Indiarubber.
F. indica is an immense tree, spreading very wide, the branches ash-colored, and throwing down roots into the soil. Marsden mentions one of these growing near Memgee, twenty miles west of Patna, in Bengal, which was in diameter 370 feet; the circumference of the shadow at noon was 1116 feet, and there were fifty or sixty stems. It is called the priest's tree, and held in so much veneration by the Gentoos, that if any one cuts or lops off a branch, he is looked upon with as great abhorrence as if he had broken a cow's leg. F. religiosa is so called, because it is sacred to the idol Vishnu. The horizontal branches root into the soil like the other; all the species are of remarkably easy culture, and root easily from large cuttings.
of Filices and their nearest allies, to introduce some alterations into the form of the pages of this work. These alterations commence with Musci.
The orders of Cryptogamia being equal in importance to the classes of flowering plants, they will be treated of as the classes have hitherto been treated. Each order will, therefore, stand by itself, and will have its genera and species arranged under it, without immediate connection with any other order.

Order 1.

\section*{FILICES.}

Reproductive organs uniform. Thece naked, or having an involucre placed on the back of a frond, which is either foliaceous, or contracted so as only to cover the clusters of thece, and always circinate when young.
This is the most beautiful of all the orders of Cryptogamic plants, and has always been a favorite tribe, to which the most celebrated botanists of all modern times have given their attention. Till some time, however, after the death of Linnæus, ferns shared the fate of all other departments of botany, being viewed rather as objects of elegant form than of scientific examination. Sir James Edward Smith was the first author who attempted to distribute them into genera, by characters derived from a minute inspection of their organs of reproduction; and his arrangement, however imperfect it may now be considered, is certainly that upon the principles of which the more precise divisions of recent authors have been effected. He was succeeded by Swartz, Willdenow, Brown, and many others, and lastly by Dr. George Frederick Kaulfuss, Professor of Botany at Halle, whose arrangement of 1824 is chiefly here adopted as being the most recent which has been published.

The principal distinction which exists between ferns and other orders of Cryptogamous plants is found in the situation of what are called their sori, or patches of reproductive organs, which are in all cases inserted upon the back surface of the leaf, or, as it is called in ferns, the frond, sometimes appearing only in the form of little spots, sometimes covering the whole of the under side of the frond, and sometimes contracting the substance of the frond, so as to give it the appearance of a single mass of fructification, bursting in a determinate manner, as in Ophioglossum, Schizæa, \&c. Besides this character, the fronds are always rolled up in a circinate manner when they are first developed.

That part of the frond which occupies the place of the petiole of a compound leaf is called the rachis. The groups of thecæ forming the organs of reproduction are called sori ( \(a\) ), which are either naked or covered with an involucrum, or, as it is more frequently termed, indusium. (b) This latter organ, when present, either bursts outwardly towards the margin of the frond, or inwardly towards the midrib or rachis. It may also be either single or double; the latter term signifying, that there is a cover on each side the sorus. The bodies which are called thece by some authors, and capsules by others, are constructed in two ways; they are either surrounded
by an elastic furrowed ring, when they are called Annulate (c), or they are destitute of such a ring, in which case they are termed Exannulata (d). They contain the minute powdery matter, which is that by which ferns are reproduced; the constituent parts of this matter are called sporules (e), and are analogous to seeds in more perfect plants.

\section*{Tribr I. POLYPODIACEA.}

Theca 1-celled, with an articulated, elastical, longitudinal ring, bursting across in an irregular manner.
2168. Polybotrya. Thecæ closely covering the whole surface of the pinnules of an altered frond. Indusiun none,
2169. Acrostichum. Thecæ scattered, occupying all the lower surface of the frond, or a part of it. Indusium none.
2170. Hemionitis. Thecre seated on the reticulated veins of the frond. Indusium none.
2171. Gymnogramma. Thecreseated on the forked veins of the frond. Indusium none.
2172. Meniscium. Sori linear, lunulate, somewhat parallel, placed across the spaces between the veins of the fronds. Indusium none.
2173. Xiphopteris. Sori oblong, oblique, placed on the reflexed points of the frond. Indusium none.
2174. Ceterach. Sori linear, transverse, concealed under paleæ, Incusium none.
2175. Polypodium. Sori in little round scattered convex spots. Indusium none.
2176. Tanitis. Sorus linear, longitudinal, placed between the midrib and margin of the frond under the end. Indusium none.
2177. Nothochlana. Sori almost marginal, continuous, covered by the scales, setæ, or hairs of the frond. Indusium none.
2178. Onoclea. Sori globose, inserted upon columnar receptacles, inclosed within the berry-like pinnules. Indusium double : common placed on the edge of the pinnule, and united into the form of a berry; proper membranous enwrapping the sori.
2179. Struthiopteris. Sori linear, crossing, inserted upon crested receptacles, included in a double row within the somewhat articulated pinne. Indusium double: common marginal opening inwards in a rugged manner; proper membranous, and resembling a partition.
2180. Allosorus. Sori placed on the transverse forked veins of spike-like pinnules, finally becoming confluent. Common indusium very narrow, arising from the revolute margin which is rolled inwards.
2181. Ellebocarpus. Thecæe globose, irregulariy attached to the longitudinal veins of the frond. Indusium transparent, discolored, arising from the revolute edge of the frond, continuous, and opening by a longitudinal suture.
2182. Lomaria. Sori linear, continuous, occupying the surface of the linear pinnæ of a particular frond. Indusium marginal or submarginal, conniving, involute.
2183. Blechnum. Sori linear, continuous, (sometimes interrupted) contiguous to the midrib. Indusium membranous, superficial, continuous, opening inwards.
2184. Woodwardia. Sori oblong, distinct, in rows, parallel, contiguous to the midrib. Indusium membranous, superticial, vaulted, opening inwards.
2185. Doodia. Sori lunulate, distinct, parallel with the midrib. Indusium membranous, superficial, flat, separating inwardly.
2186. Asplenium. Solì linear, placed upon lateral veirs. Indusium membranous, flat, separating inwardly.
2187. Allantodia. Sori oblong, oblique with respect to the midrib. Indusium membranous, vaulted, cylindrical, adhering to a vein, opening inwards, finally spreading outwards,
2188. Scolopendrium. Sori linear, oblique, opposite, double, parallel. Indusia membranous, opening in opposite pairs.
2189. Diplaxium. Sori linear, double alongside the veins. Indusia double, narrow, placed between the sori, fixed lengthwise by the middle, with their exterior margin separate.
2190. Pteris. Sori continuous, linear, marginal. Indusium from the inflexed edge of the frond, opening inwards.

\section*{POLYPODIACEE.}
2168. POLYBO'TRYA. H. \& B, Polybotrya. 14442 cervina Kaulf.

\section*{History, Use, Propagation, Culture,}
2168. Polybotrya. So called in allusion to the numerous bunches of the fertile divisions of its frond; from roivs, many, and ßorgus, a bunch. Handsome species of West Indian and South American ferns. The genera of ferns are not very dissimilar in habit, so that it will be seldom that any remarks upon that subject will be found in these notes, which must necessarily consist chiefly of the etymology of the names. The medical properties are probably the same in all the genera; such as appear of any consequence are, however, inserted in the proper places. We will here take occasion to remark, that the cultivation of ferns is nearly the same in all cases, and that the soil best adapted for their growth is light peaty earth with a little loam. They are propagated by division of the roots, or by seeds or sporules. The latter plan has been practised at Liverpool,
2191. Vittaria. Sori solitary, continuous, linear, marginal or submarginal, immersed. Indusium double, superficial.
2192. Lonchitis. Sori lunate, marginal, placed under the recesses of the frond. Indusium from the margin of the frond, inflexed, opening inwards.
2193. Antrophyum. Sori linear, continuous, immersed in the reticulated veins of the frond. Indusium double, opening in the middle.
2194. Adiantum. Sori inserted into the indusium, linear, contiguous, or roundish. Indusium marginal, opening inwards, either nearly coutinuous, or squamiform, or reniform.
2195. Cheilanthes. Sori dot-like, separate, marginal in the recess of the indusium. Indusium either reflexed crenules of the frond, or squamiform, membranous, and arising from the margin, or nearly continuous, opening inwards.
2196. Davallia. Sori roundish, nearly terminal and marginal, distinct. Indusium superficial, attached inwards, and opening outwards.
2197. Dicksonia. Sori dot-like, marginal, solitary in the recesses of the frond. Indusia membranous, nearly globose, marginal, adnate, opening unequally with lacerated orifices, and spreading back in all directions.
2198. Balantium. Sori oblong-linear, nearly terminal and marginal, transverse. Indusium coriaceous, reniform, 2 valved, opening outwards: upper valve marginal, patera-shaped; lower nearly flat.
2199. Aspidium. Sori roundish, scattered. Indusium solitary, orbicular, peltate, or reniform.
2200. Woodsia. Sori dot-like, scattered. Indusium membranous, placed under the sori, somewhat paterashaped and ciliated.
2201. Cyathea. Sori globose, scattered, inserted upon an elevated receptacle, which arises from a division of the vein. Indusium spherical, opening in the middle, and finally becoming patera-shaped.
2202. Trichomanes. Sori marginal, inserted upon a long setaceous receptacle. Indusium erect, campanulate.
2203. Hymenophyllum. Sori marginal, inserted upon a claviform receptacle. Indusium erect, 2valved.

\section*{Tribe 11. OSMUNDACEE.}

Thece without a ring, netted, pellucid, with radiating strie upon their top, bursting lengthwise on one side.
2204. Todea. Sori oblong, seated upon forked veins of an unchanged frond. Theca globose, stalked, netted, opening from their base as high as a pellucid dorsal projection. Indusium none.
2205. Osmunda. Sori nearly globose, alternately arising from the margin of a frond, which becomes changed into a panicle. Thecæ globose, stalked, netted, opening from their base as high as a pellucid dorsal projection. Indusium none.
2206. Lygodium. Thecæ oblong-ovate, striated at the end in a radiate manner, seated in two rows upon 1-sided marginal spikelets, fixed by their backs and opening lengthwise in front. Indusium funnel-shaped, covering up each capsule.
2207. Anemia. Thecæ ovate, striated at the top in a radiated manner, disposed in compound unilateral spikes, attached by the base, and opening lengthwise. Indusium none.

\section*{Tribe III, OPHIOGLOSSEA.}

Theca 1-celled, adnate at base, roundish, coriaceous, opaque, without a ring, not vascular, sometimes fastened together, half-bivalved.
2208. Botrychium. Thecæ naked, globose, distinct, attached to the rachis of a compound spike, half 2 valved, opening nearly at one side.
2209. Ophioglossum. Thecæ naked, connate in a distichous jointed spike, half 2 valved, opening at the side.
2210. Marattia. Sori oval, somewhat marginal. Thecæ united in a double row, opening inwards by a cleft. Indusium arched, opening lengthwise above, 2-valved, inclosing on each side a row of thecr.

\section*{and Miscellaneous Particulars.}
by Mr. H. Shepherd, with so much success, that his method has been made the subject of a communication to the Horticultural Society, of which the following is an extract. "Having provided a common garden-pot four and a half inches in depth, and three and a half wide, let the bottom part, to the height of one inch, be filled with fragments of broken pots, by way of drain. Over these should be spread a stratum of such soil as is commonly used for potting greenhouse plants, of the depth of two inches; the remaining inch and half should be filled with brown loamy earth sifted through a hair-sieve, the surface being made perfectly smooth, and on this the seeds are to be scattered as evenly as possible. Care must be taken that the wind be not suf. fered to hlow the seeds away, leaving nothing but empty capsules, The seeds being sown, no other covering is

History, Use, Propagation, Cullure,
required than a bell-glass, which should just fit within the rim of the pot, so as to exclude all air. The pot is then to be kept in a pan always half full of water, and set in a shady part of the stove or hot-house, being always regularly watered as above directed. When the young plants have acquired their second leaf, it is proper to give them a little air, by placing a small piece of wood under the edge of the glass, at one side. In a short time afterwards the glass may entirely be removed."
The vegetation of ferns appears to be less tardy than botanists have supposed. Specimens of Gymnogramma tartareum having been brought from Jamaica to Liverpool, on the tenth of July 1817, a few seeds were brushed off them and sown immediately. Several plants thus obtained perfected seeds by the fifth of August 1818, which being committed to the earth, had produced young plants, covering the surface like a fine moss, by the eighth of September following. Specimens of Pteris cretica, and another marked Pteris acrostichoides, from William Jackson Hooker, Esq., afforded seeds which have vegetated and produced very fine plants of both species. Dr. William Carey sent from Serampore specimens of Polypodium giganteum, and what appears to be a new Diplazium. These reached Liverpool, July the tenth 1818 ; their seeds being immediately sown, had produced young plants by the eighth of September. A small fern from Sicily, with several others of this tribe, collected in the Brazils by William Swainson, Jun., Esq., afforded ripe seeds, which being sown in the spring of 1818, had partly vegetated, and in September nad produced Polypodum decumanum, as well as Gymnogramma calomelanos. Mr. Shepherd obtained two plants of the latter from seeds brushed from the specimens in the Herbarium of Dr. John Reinhold Forster, now belonging to the botanic garden at Liverpool, and perhaps fifty years old. He made the experiments on other ferns in that collection, but without success, which, indeed, is not wonderful.

The seeds of this order of plants are of course liable to damage from damp or other accidents, like those of plants in general. It seems, moreover, that they are very soon shed by the bursting of their capsules, so that

they are more likely to be found in such specimens as are just beginning to turn brown in their fructification, than in others more advanced.
2169. Acrostichum. Said to be formed from the words axgos sixos, the commencement of a verse, and to have been so called because the reverse of their leaves indicates traces of lines, resembling the beginning of lines of poetry. These are fine, chiefly tropical, ferns, one of which, A. aureum, sometimes grows to the height of five or six feet.
2170. Hemionitis. Said by Dioscorides to be so called from the resemblance of its nature to that of a mule, भुpsovos; it was always considered sterile, bearing neither flowers nor fruit.
2171. Gymnogramma. Named by Desvaux from ruнyos, naked, and reoн \(\mu \kappa\), writing, in allusion to the disposition of the naked sori upon the forked veins of the frond, whence they seem to resemble Roman letters. The species have been separated from Hemionitis and Acrostichum.
2172. Meniscium. From uryn, the moon; the sori are crescent-shaped. These ferns are remarkable for the arrangement of their veins. The little veins which unite the transverse veins of the sterile frond are usually at right angles, and generally united with each other by a little branch which sets off from one or other of their angles. In the fertile fronds the veins on which the sori are placed are either curved or straight.
2173. Xiphopteris, Divided from Grammitis by Kaulfuss, who seems to have named it from and \(\tau \pi \varepsilon \rho^{2} \xi\), a fern, on account of the sword-like form of their fronds.
2174. Ceterach. The name emploved by the Arabian and Persian physicians for this plant was Chetherak. (Gazoph. Ling. Pers. p. 377.) They employed the plant in obstructions of the viscera, for the jaundice, and for disorders of the spleen.
2175. Polypodium. From \(\pi 0 \lambda v \varsigma\), many, and \(\pi \varangle \varsigma \pi \circ \delta o s, \bar{a}\) foot, on account of the multitude of the roots which form close entangled patches. Many of the species of this genus are noble plants. They are mostly epiphytic

History, Use, Propagation, C'ulure,
upon trees. Polypodium vulgare is sometimes burnt for the sake of its ashes, which contain a large proportion of carbonate of potash, which is employed in the fusion of flint for some kinds of glass-ware.
2176. Tanitis. From the resemblance of the interrupted line of sori to the tania or tape-worm.
2177. Nothochlana. From yoitos, spurious, and \(\chi^{\lambda \alpha \omega s} \alpha\), a cloak. So called because the sori are not enclosed in a genuine indusium, but are frequently covered over by the paleæ of the frond. A genus extracted by Mr. Robert Brown from the ancient Acrostichum,
2178. Onoclea. A name given by Dioscorides, Pliny, and Galen, to a Boragineous plant, and strangely applied by the moderns to a genus of ferns. O. sensibilis has been so called from the delicacy of its frond, which is so impatient of injury as to perish with almost the least violence.
2179. Struthiopteris. Named from Figov-9os, an ostrich, and \(\pi \tau \varepsilon \rho 15\), a fern, on account of the similarity
between its fine fronds and the feathers of an ostrich. A genus divided from Osmunda by Willdenow.
2180. Allosorus. From \(\alpha \lambda \lambda 0 s, v a r i o u s\), and sorus; a name contrived by Bernhardi, in a paper printed in Schrader's Journal, we presume in aliusion to the different states of the sori at different periods. A curious little rock plant.
2181. Ellobocarpus. Named by Kaulfuss, from \(\varepsilon \lambda \lambda a \beta o s\), enclosed in a pod, and zagros, fruit, in allusion to the pod-iike form of the divisons of the fronds on which the sori are placed.

14475 Fronds deeply pinnatifid glaucous : segments lanceolate acuminate repand serrate, Sori in rows 14476 Fronds pinnate, Leafiets lanceolate acuminate repand wavy distant
14477 Fronds lanceolate entire smooth or somewhat scaly rigid erect, Sori solitary
14478 Fronds simple 3-lobed and pinnatifid: segments lanceolate acuminate opposite, Sori scattered immersed
14479 Sterile fronds sessile ovate sinuated: fertile pinnatifid; segments lanceolate
14480 Fronds on a creeping stem lanceolate acuminate entire sublucid with flexuous veins, Sori scatteredi
14481 Sterile fronds oblong entire: fertile linear lanceolate repand, Sori solitary, Stem paleaceous rooting
14482 Fronds tinear lanceolate much tapered at the base somewhat repand quite smooth, Sori scattered
14483 Ster. fronds obl. lanc. taper, at base : fert. lin-lanc. bear, sori on upp, half, Sori oval immers. in dense wool 14484 Fronds pinnate, Pinn, somewhat stalked oblong acuminate coarsely and bluntly serrated, Sori in rows

14485 Fronds simple lanceolate acute at each end nearly entire fructifying at end
14486 Fronds bipinnate woolly : pinnules elliptical obtuse covered all over with long wool

14487 Pinnz lanceolate acute cut toothed: pinnules and rachis smooth
14488 Pinnæ pinnatifid with rounded lobes : pinnules villous, Rachis scaly
14489 Sterile fronds bipinnatifid: segments entire acute equal
14490 Sterile fronds bipinnatifid: segments entire obtuse; lower long acute
14491 Fronds supradecompound, Pinnæ altexnate roundish cut

14492 Alternate pinna pinnulate on the upper-side linear: lower 2-parted
14493 Sterile pinnæ long-lanceolate acuminate cuneate at base repand-toothed : fertile linear
14494. Fronds pinnated smooth, Pinnæ linear bluntish entire nearly equal at base

14495 Fronds pinnated, Pinnæ linear-lanceolate mucronate auricled at base scabrous at edge
14496 Fronds pinnated, Lower pinnæ opposite lanceolate entire subcordate at base: upper alternate united

14497 Fronds pinnate-pinnatifid : segments lanceolate acuminate somewhat repand finely serrulate 14498 Fronds very smooth pinnate, Pinnæ sessile lanceolate pinnatifid, Segments oblong blunt crenulate

14499 Fronds lanceolate pinnatifid : segm. linear ensiform acuminate spinulose, Sori lanceolate in two rows
14500 Fronds pinn. : pinnæ cordate pinnatifid; segm. ovate rather acute, lower and terminal usually 3-lobed
14501 Fronds bipinn. : pinnules obl. lanc. cut serrated: serratures 2 or 3 -toothed nearly acute, Sori obl. straight 14502 Fronds bipinn. : pinnæ obl. lanc. acute ; pinnules oblong pinnatifid cut, Sori becoming confluent 14503 Fronds bipinn. : pinnules pinnatifid; segments 3 or 2-toothed
14504 Fronds bipinn. : pinnules obovate blunt cuneate at base acutely toothed at end, Sori becoming confluent 14505 Fronds bipinn. : pinnules oblong acute at each end serrated at end : upper confuent 14506 Fronds alternately decompound : pinnæ rhomboid cuneiform spreading bitten at end

2182. Lomaria. From \(\lambda \omega \mu \mu\), an edge, on account of the marginal position of the indusia. These are fine plants, resembling Acrostichum in habit.
2183. Blechnum. One of the Greek names of the fern was \(\beta \lambda\) \& \(\chi\) vov. Athenæus writes it \(\beta \lambda \propto \chi\) voy, and derives it from \(\mathrm{b}_{2} \lessdot \xi\), powerless, insipid.
2184. Woodwardia, Named by Sir James Smith, after his friend Thomas Jenkinson Woodward, Esq., a good practical English botanist. One of the species produces little hairy bulbs at the axillæ of the leaves, which either fall off and strike root in the ground, or vegetate while attached to the parent plant. This property is common to many other ferns, and in one instance, the young plants so produced have been mistaken in Pteris cornuta for parasites by an acute cryptogamic botanist.
2185. Dooria. So called in honor of Samuel Doody, a London apothecary, who was almost the first investigator of British cryptogamic plants. Small rough-leaved ferns of rigid texture.
2186. Asplenium. From \(\alpha\), privative, and \(\sigma \pi \lambda \eta y\), the spleen. This plant was formerly held to be a sovereign remedy for all diseases of this organ, and to be so powerful as even to destroy it if employed in excess.

2193. ANTRO'PHYUM. Kaulf. Antrophyum.

14549 lanceolátum Kaulf. spear-leaved \(\subset \Delta\) or Hemionítis lanceoláta L.

\section*{History, Use, Propagation, Culture,}
2187. Allantodia. So named from aגдcerros, a sausage, or scrt of small pudding, to which the cylindrical arched indusia bear considerable resemblance.
2188. Scolopendrium. On the lower surface of the fronds of this plant are to be seen little marks which bear a likeness to the insect called Scolopendra. It is probable that the supposed varieties of this plant are distinct species. One of them has been ascertained not to alter in being raised from seed.
2189. Diplaxium. From \(\delta \iota \pi \lambda \propto \sigma t s\), double; the indusia are double. Handsome ferns of large size; one forms a small tree.
2190. Pteris. The Greeks called ferns in general by this name, because they generally resemble plumes, \(\pi \tau \rho v \check{\xi}\), in their light and divided appearance. Pteris aquilina is the common brake, well known as an excellent covert for game, and for serving for many household purposes in the north of England. It is used as litter for

14507 Fronds pinnated : pinnæ cuneate ovate acute deeply pinnatifid; segments lanc. cuneate unequally toothed 14508 Fronds pinnated : pinnæ stalked oblong acuminate pinnatif, ; segm, obl. obt, sharply serrat. Sori parallel 14509 Fronds pinnated : pinnæ ovate repand somew. auricled ; term, remote small entire, Fronds rooting at end 14510 Fronds pinnated : pinnæ alternate elliptical roundish crenate, Rachis flattened beneath
14511 Fronds pinnated : pinnæ roundish blunt crenated cuneate at base, Stalk discolored
14512 Fronds pinnated : pinnæ ovate-roundish crenate, Rachis shining keeled beneath
14513 Fronds pinnated : pinnæ alternate cuneiform erect eroded at end
14514 Fronds pinnated: pinnæ sessile lanceolate serrulate cordate at base auricled upwards
14515 Fronds pinnated : pinnæ lanceolate blunt equally and bluntly serrated, Sorus one on each pinna
14516 Fronds broad-lanceolate subsessile, Sori very near parallel contiguous to the midrib
14517 Fronds pinnated: pinnæ ovate oblique serrated obtuse unequal at base cuneate
14518 Fronds pinnat. : pinnæ altern, ; upp. usually opp, lin.-lanc. subrepand truncat. at base above rounded below 14519 Fronds pinnated trifid: pinnæ alternate linear torn at end
14520 Fronds lanceol. stalked rather crenate auricled cordate at base at the end very long linear-filiform rooting 14521 Fronds lanceolate on short stalks acuminate serrated tapered at base and entire, Sori contiguous parallel 14522 Fronds pinnate : pinnæ lanceolate taper-pointed at end pinnatifid; segments bifid, Stalk shining glabrous 14523 Fronds ternate: middle leaflet pinnatifid; lateral 3-parted toothed
14524. Fronds pinnated : pinnæ obl. lanceolate acuminate coriaceous serrated at end tapered at base, Stalk chaffy 14525 Fronds 3 pinnated: pinnæ oblong lanceolate with very long points, Sori becoming confluent
14526 Frond 5-lobed cordate, Three middle lobes acuminate
14527 Fronds bipinnate : pinnules oblong pinnatifid; segments lanceolate finely bidentate, Sorus sclit. at base 14528 Fronds 3-pinnate : pinnules lanceolate decurrent cut serrated, Sori contiguous finally becoming confluent

14529 Frond simple cordate-lingulate smooth beneath

14530 Fronds pinnat. : pinnæ lanc. serrat. at end truncate at base above rounded and somew. wedge-shaped below 14531 Fronds pinnat. : pinnæ lanc. coarsely toothed; teeth rounded serrated at end tapered and finely toothed

14532 Fronds pinnated : pinnæ linear auricled cordate at base serrulate, Stalk and rachis paleaceous hairy 14533 Fronds pinnated : pinnæ oblong lanceol, on short stalks entire cuneate at base, Stalk and rachis smooth 14534 Fronds pinnated : pinnæ lin. decurrent; lower 3-parted, Sterile acutely serrated : fertile ent. serrul. at end 14535 Fronds decompound: lower bipinnate; pinnules lanceol. retuse at base, terminal longer, Stalk pubescent 14556 Fronds bipinnatifid, Lower branches twin 2-partite below, Pinnules lanceolate subfalcate sharply serrated 14537 Fronds supradecompound: pinnæ broad-lanceolate pinnatifid, Stem and branches prickly
14538 Fronds tripinnate: pinnules linear decurrent downy beneath; those at the end longest, Rachis smooth 14539 Frond 3-parted, Branches bipinnate, Pinnules linear elongated blunt entire: lower bipinnatifid 14540 Frond 3-parted, Branches bipinn. Pinnules lin. lanc. : upper undivided; lower pinnatif. Segm, obl. blumt 14541 Frond pedate, Branches pinnate, Pinnules obl. lanceolate acumin. pinnatifid, Segm. oblong acute serrated 14542 Fronds pinnat. : pinnæ lanc. acum. on short stalks tapered and serrated at base ; lowest 2-parted or ternate 14543 Fronds bipinn. : pinnules somew. stalked ovate-lanc. blunt crenulate; lower hastate 3-lobed, Stalk smooth 14544 Fronds deeply 5 -lobed palmate, Lobes pinnatifid: segments linear lanceolate acumin. Recesses rounded 14545 Fronds deeply 5 -lobed palmate, Lobes pinnatifid: segments linear lanceolate acute, Recesses acute 14546 Pinnæ opposite pinnatifid, Nerve above a little strigose, Pinnules lanceolate blunt entire, Petiole smooth

\section*{14547 Fronds linear very long pendulous, Sori solitary within the margin}

14548 Fronds bipinnate hairy : pinna pinnatifid acuminate; segments blunt, Stalk and rachis villous
14549 Fronds linear-lanceolate tapered at each end ribbed, Sori reticulated

and Miscellaneous Particulars.
cattle, and very frequently for the purpose of thatching cottages. The ashes are employed in the manufactory of soap and glass. Its astringent quality has recommended it in dressing and preparing kid or chamois leather. The country people take it medicinally to destroy worms, and a bed made of the green plant is esteemed a sovereign cure for the rickets in children.
2191. Vittaria. From vitta, a ribband, on account of the narrow ribband-like appearance of the fronds. Small simple-leaved grass-like plants, of difficult cultivation.
2192. Lonchitis. From \(\lambda .0 \nu \chi \eta\), a lance, on account of the form of the fronds of some species. The Gleeks had a plant named \(\lambda o y \chi \chi^{\prime \prime} 15\), but it must have been very different from that of the moderns.
2193. Antrophyum. A genus divided by Kaulfuss from Hemionitis, and named from anr¢os, a cavern, and \(\phi v a\), to grow, in reference to its native places of habitation.

\section*{History，Use，Propagation，Culture，}

2194．Adiantum．From aìscevroc，dry．In vain you plunge the Adiantum in water，says Pliny，it always remains dry．The prettiest of all ferns，on account of the delicate slender stalks on which the pinnules are balanced in the air；one species on this account is called Capillus Veneris，or in English，Maiden＇s Hair．

2195．Chcilanthes．From \(\chi\) Einos，a lip，and \(\alpha y\) ， 05 ，a flower，in allusion to the lip－like form of the indusium． Pretty plants，formerly referred to Pteris．
2196．Davallin．Named by Sir James Smith，after his friend M．Davall，a Swiss botanist，who sent him large collections of plants．D，canariensis is popularly called the hare＇s－foot fern，on account of the peculiar form of its rootstock，which curves over the side of the pot in which it grows，and，being covered with close brown hairs，resembtes very perfectly the foot of a hare．

2197．Dicksonia．In honor of the late Mr．James Dickson，a celebrated British cryptogamic botanist．A noble genus containing several arborescent species，among which the tree－fern of St．Helena is placed．This plant is often brought in a living state to this country，but the mode of cultivating it being unknown，it rarely survives more than a few months．
2198．Balontium．A genus of Madeira ferns，divided from Dicksonia by Kaulfuss，on account of its trans－ verse two－valved indusium；and named from \(\varrho_{\alpha}\) ；cevestav，a purse，on account of the form of the indusium．

14573 Fronds bipinn. : pinnules ov, obl. lobed pinnatif, ; segm, linear-oblong blunt nearly entire, Rachis winged
14574 Fronds bipinn, : pinnules lanceolate acuminate pinnatifid; segments linear acute serrated, Rachis winged
14575 Frond lanceolate pinnate : pinna deeply pinnatifid cut toothed, Rachis quadrangular, Sori lateral
14576 Fronds tripinnate: pinnules pinnatifid; segments linear toothed at end
14577 Fronds simple cordate 3-lobed or ternate : middle larger; lateral auricled at base
14578 Fronds pinnate : pinnæ ciliate serrate, Stalk strigose
14579 Fronds pinnate: pinnæ falcate lanceolate serrate truncate at base auricled above
14580 Fronds pinn. : pinnæ lanc. subfalcate cordate at base gibb. and somew. serrul. on upper edge, Sori solitary
14581 Fronds pinnate: pinnæ ensiform serrated, Serratures half ovate ovate nerved
14582 Fronds pinn.: pinnæ ensiform attenuated at end downy ben. cut. pinnatif. Sori almost marginal contiguous 14583 Fronds pinn.: pinnæ pinnatif. ; segm, lanc. ac, Lowest of last pinnæ longest pinnatif, cut, Veins hairy ben. 14584 Pinnæ pinnatifid somewhat linear : pinnules oblong nearly entire, Sori in rows near the edge of pinnæ
14585 Fronds pinnate : pinnæ lanceolate glabrous resinous glandulose beneath pinnatifid; the segm. lanceolate obtuse entire, lowermost ones longer, Sori marginal
14.586 Fronds pinn. : pinnx lin. lanc. pinnatif. glab. : segm. ov. ac. ent. Sori marginal contigu, at length confluent 14587 Fronds pinnate : pinnæ subcordate oblong pinnatifid; segments oblong obtuse dentato-serr. Stalk chaffy 14588 Fronds bipinnate: pinnules rigid ovate sublunate acum, aristate oblique and cuneate at base and decurr.; the margins faintly serrated spinulose with a tooth near the base on upper side, Stalk and rachis chaffy 14589 Fronds bipinnate : pinnules oblong obtuse decurrent crenate. Crenatures of base deepest, Sori marginal 14590 Fronds bipinn. : pinnules obl obt. serrat. mutic. Sori near the central nerve, Stalk and rachis chaffy 14591 Fronds bipinnate: pinnules scarcely rigid ovate rather obt. aristate truncate at base which has a lobe on the upper margin shortly petiolate; the margin deeply serrated and spinulose, Stalk and rachis chaffy

and Miscellaneuns Particulars.
2199. Aspidium. From aбтis, a little buckler, on account of the form of the indusia. Fougere, Fr., Johannis wuptzel, Ger,, Feli Maschia, Ital., and Polypodio Helecho Masculino, Span. The male fern is common to Europe, in shady places and woods. The root consists of many matted fibres, forming a turfy or cespitose head, of the thickness of the finger, blackish and scaly. It has been celebrated from time immemorial as a specific for worms. It appears to have been used as such by Theophrastus, Dioscorides, and Galen; but seems to have been neglected by the moderns, with the exception of empiric practitioners, until the publication of Madame Nufer's specific for the tape-worm by the French government again brought it into notice. According to her plan of administering it, from one to three drachms of the powdered root were directed to be taken in a large cupful of water in the morning, while the patient was in bed; and two hours afterwards, a strong cathartic of calomel and gamboge, proportioned to the age and strength of the patient, was given; and if necessary, the further operation was promoted by a dose of purging salts; nothing but broth being taken till the worms came away. If this, however, did not happen on the same day, the process was ordered to be repeated on the next day. In the present state of medical science, oil of turpentine is considered a certain specific
for expelling tænia. (Thom. Lond. Disp. 186.)

Aspidum Baromez is the famous Scythian lamb, of which so many fables have been related. Although it

History, Use, Propagation, Culture,
is often brought in a fresh state to the markets of Macao, as an article of medicine, no plants have ever reached this country alive. Its name has arisen from the resemblance which its brown hairy rootstalk bears to a little rufous dog couching; and the belief in its animal nature has been confirmed by the color of the juice, which is of a rich blood color, and soon becoming thick by exposure to the air. It is needless to add, that the stories about no plant being able to grow near it are mere fables. Kæmpfer says, that borannek is the name which the people on the borders of the Caspian Sea give to a kind of sheep of that country.
2200. Woodsia. Small ferns formerly referred to Polypodium, Aspidium, and Nephrodium, by various writers; and distinguished from all these by Mr. Brown, who named the genus after Mr. Joseph Woods, an ingenious British botanist.
2201. Cyathea. From «u\&Go5, a cup; on account of the cup-shaped form of the indusia. A fine tropical genus of ferns, which does not appear to have been well understood by its author, who confounds it with little British plants referred by all other botanists to Aspidium. Nearly all the species are arborescent, and arrive at the greatest height of which ferns are susceptible. C. glauca forms a lofty tree in the Island of Bourbon, and C. speciosa and excelsa are not less than twenty-four feet in height.
 now called Asplenium trichomanoides, on account of its fine shining stems, which resemble hairs. Elegant plants with almost transparent foliage.

14592 Frond somew. bipinn. : pinnules decurrent ellipt. pinnatifid serrul. spiny, Rachis smooth, Nerves flexuose 14593 Fronds bipinnate : pinnules oblong distinct inciso-pinnatifid; segments mucronato-serrate, Stalk chaffy 14594 Fronds bipinnate : pinnæ pinnated bipinnatifid below; pinnules lanc. blunt, Segments ovate toothletted 14595 Fronds 3-pinnate: pinnules oblong blunt hairy above, toothed, Stalk and rachis bristly chaffy

\section*{and Miscellaneous Particulars.}
2203. Hymenophylum. From i \(\mu\). This and the last are the most elegant of all ferns; they generally grow in damp shady places amiong moss, and have hitherto refused cultivation under any plan which has been devised.
2204. Todea. Named after Tode, an experienced mycologist, author of Fungi Mecklenburgensis. Mr. Brown unites this genus to Osmunda, but Kaulfuss keeps them distinct.
2205. Osmunda. A word said to be of northern origin, and to have received its name on account of its potential qualities in medicine. Osmunder was one of the names of Thor, a Celtic divinity, and mund, in Anglo-Saxon, is expressive of force or power. These are noble species of hardy ferns. O. regalis is the finest of all our native species.
2206. Lygodium. From \(\lambda v y o s\), a band. The species are elegant twining plants, which bind together the grass or small shrubs near which they chance to grow. L. palmatum, although a North American plant, must have the protection of a good frame.
2207. Anemia. From \(\alpha y \varepsilon \mu \omega y\), naked; in allusion to the naked spikes of inflorescence; whence some authors write the word Aneimia
2208. Botrychium. Derived from ßareus, a bunch, on account of the bunch-like form of its fructification. Botrychium virginicum is the largest of the American kinds, and is called the rattle-snake fren, from the circumstance of its generally growing where these venomous reptiles are usually found.
2209. OPHIOGLOS'SUM. L. Adder's-Tongue. 14621 vulgátum \(W\).

History, Use, Propagation, Culture,
2209. Ophioglossum. Frum opis, a serpent, and \(\gamma \lambda \omega \sigma \sigma \eta\), a tongue. The little green narrow-pointed leaves, seated on a narrow stalk or neck, and peeping up from among the grass, may be not unaptly compared to a snake's tongue.

14621 Frond ovate veinless
14622 Spike cauline, Frond cordate acute reticulated
14623 Spike cauline, Frond subcordate ovate obtuse, Root bulbous

14624 Fronds bipinnate: pinnules acutely serrate, Rachis scaly : partial winged

\section*{and Miscellaneous Particulars.}
2210. Marattia. In honor of J, F. Maratti, a writer upon ferns. He lived at Vallombrosa, in Tuscany. Kaulfuss considers this, Danæa, and Angiopteris as constituting a particular tribe, which he calls Marattiacex, but of which he has not given the characters.

Reproductive organs wniform, in terminal spikes, composed of peltate, several-sided scales, producing on their under surface 4-7-elongated involucres containing the seeds. Branches whorled, rigid.
This order contains one genus only, which is among the most puzzling of all the anomalous formations which are so frequently met with among the lower orders of vegetation. Both the stems and branches are regularly articulated, and arise from a tubular sheath. There are no leaves, and the reproductive organs are arranged in a terminal spike ( \(b\) ), on all sides of which are inserted many peltate scales ( \(a\) ) with several sides or angles. Several wedge-shaped hollow bodies project from the surface of these scales, and bursting inwardly, discharge their contents, which are not yet well understood. They consist of a number of green roundish bodies, surrounded by minute granules, and furnished at the base with four elastic filaments (c), thickened at their apex. By some observers the granules have been considered pollen, the filaments stamens, and the green bodies ovaries; by others the granules have been called naked seeds; by Kaulfuss the wedge-shaped hollow bodies are considered capsules, and the green bodies, seeds. It is probable that none of these theories are true.
2209. Equisetum. Character the same as of the order.

2211. Equisetum. Literally, horse-hair, from equus, a horse, and seta, hair; so called, in allusion to the fine branches of all the species. The first five species are noxious weeds on deep loamy soil, especially such as has been gained from rivers or lakes. E. fluviatile rises three or four foet high, the thickness of a finger, with numerous branchlets or leaves proceeding from the whorls; according to Haller, this species was eaten by the common penple among the Romans. Linnæus affirms, that rein-deer, who refuse hay, will, however, eat this;

14625 Ster. stems decumb, with simp, branches, which are rough. tetragon. : fertile ones erect simp. their sheaths cylind, inciso-dentate
14626 Sterile stems with very numerous simple branches, which are roughish octagonal: fertile ones simple; the sheaths infundibutiform laciniato-dentate, their teeth setaceous
14627 Sterile and fertile stems with their branches comp. roughish deflexed 4-sided, Branchlets subtriquetrous 14628 Stems branch, upw with branches about 12 in a whorl simple pentagon. smooth, Spike or catkin terminal 14629 Stems branched glabrous sulcate, Branches simple pentagonal, Spike terminal
14630 Stems naked very rough branched at base, Sheaths black with white membran. lanc. teeth, Spike terminal 14631 Stems simple erect very rough bearing spikes at the extremity, Sheaths whitish black at base and summits, Teeth aristate deciduous

that it is cut as fodder for kine, but that it is not so acceptable to horses. E hyemale is the best species for polishing wood and metal, and is imported from Holland for that purpose under the name of Dutch rushes. It is much used by whitesmiths, cabinet-makers, and comb-makers, and formerly it was in demand for scouring pewter and wooden things in the kitchen.

Order 3.

\section*{LYCOPODINEE,}

Reproductive organs axillary, sometimes apparently spiked. Theca? of two kinds, the one containing minute granules, the other larger bodies. Stems covered with many small leaves.
TaE reproductive organs of these plants are always axillary, the apparently spiked arrangement which they occasionally present being caused by the partial abortion of the leaves, at the base of which they are seated. The thecæ (a) ? the nature of which is very doubtful, and which have accordingly been called by different writers capsules, conceptacula, and cocci, are formed of from one to three valves, and of a similar number of cells, and contain either a mass of minute powdery granules, or some corpuscles of a larger size. The nature and properties of both these are uncertain. Decandolle imagines that one may be the means of fertilizing the other.
2210. Lycopodium. Thecæ reniform, 1-celled, 2-valved, wich many sporules. Sporules very minute, powdery.
2211. Psilotum. Thecæ 3-coccous, 3-celled; cells opening upwards, half 2-valved.

History, Use, Propagation, Culture,
2212. Lyconodium. From \(\lambda \nu x \circ s\), a wolf, and శะs, a foot; on account, as Dalechamp assures us, of the resemblance the roots bear to a wolf's foot. Selago is an ancient word applied to some succulent plant, and derived, according to De Theis, from the Celtic sel, sight, and jach, salutary, as being useful for complaints in the eyes. From the same root sel, was formed selma, the name of Fingal's hall, which in modern language would be called Belle-vue. The species are neat little evergreen moss-like herbaceous plants, some of which are found in all parts of the world. L helveticum is a pretty prostrate plant, with small bright green leaves; for the beauty of which it is often cultivated in hothouses on the edge of the aquarium, or in pots set in pans of water. L. Phlegmaria is a fine spectes tound in various parts of the East Indies, but hitherto a stranger to our gardens. It is a parasite upon the trunks of trees, whence it hangs down in tufts from six inches to a

14632 Stem creeping, Branches ascending, Leaves scattered incurved and hair-pointed, Spikes geminate cylindrical pedunculate: their scales ovate acuminate eroso-dentate
14633 Stem erect, Branches altern. dichotom. Leaves bifarious connate spreading at end, Spikes 4 round cylind. 14634 Stems prostrate, Branches dichotomous and fasciculated, Leaves quadrifarious oblong convex acute ap pressed, Spikes terminal solitary sessile short cylindrical
14635 Stem erect, Branches alternate compact dichotomous spreading, Spikes solitary terminal sessile
14636 Stem creeping, Branches ascending dichotomously branched, Branchlets simple, Leaves in 5 rows linear lanceolate mucronate serrulate patent, Spikes oblongo-cylindrical solitary sessile terminal
14637 Stem creeping, Branches simple solitary erect with a single sessile leafy spike at its extremity, Leaves linear scattered acute entire curved upwards
14638 Stem creep. Branches ascend, simple, Lvs, scattered lanc. subpatent ciliato-denticul. Spikes term. solitary 14639 Leaves bifarious spreading ovate acute: of the surface distichous ciliated flat, Spikes roundish sessile
14640 Lvs. bifar. \(\frac{1}{2}\)-cord. blunt. : of surface altern. distichous ovate-obl. blunt, Spikes stalked term. mostly in pairs 14641 Lvs, bifarious ovate subcord, acute toothletted: of surface altern. ovate acute, Spikes terminal short sessile 14642 Stems dichotomously branched erect fastigiate, Leaves scattered in 8 rows linear-lanceolate acuminate entire imbricated rigid, Capsules scattered not spiked
14643 Stem creeping branched, Leaves scatt. imbric. ciliated with a hair at end, Spikes solitary sessile terminal 14644 Leaves in 8 rows linear-lanceolate toothletted acute spreading reflexed, Stem ascending bifid
14645 Lvs, bifarious roundish ovate acute flat toothl. Stem branched rooting at base, Spikes term. sess. subsolit. 14646 Branches nearly simple long ascend. with one spike at top, Lvs. lin,-subul, toothed at base, Spike sess, leafy

14647 Stem dichotomous, Branches 3-cornered

and Miscellaneous Particulars.
foot in length. L. Selago is used in Skye, and some other places, to fix colours in dying, instead of alum. The Highlanders employ it in intusion as an emetic and cathartic; but it operates violently, and, unless taken in a small dose, brings on giddiness and convuisions. Linnæus says, the Swedes use a decoction of it to destroy lice on swine and other animals. All the species may be cultivated in a light peaty soil, but they require an
abundance of moisture.
2213. Psilotum. From \(\psi\) inos, naked. This is a little bushy evergreen herbaceous plant of no beauty. Its branches are 3-cornered, and altogether destitute of leaves. The thecæ appear from the little indentations of the branches, and are of a whitish-yellow color. It is easily cultivated in a little peat and sand, but it has no merit except as an object of curicsity.

Reproductive organs radical, uniform. Sporules contained in roundish one or many-celled indehiscent heads. Plants simple, aquatic.
Very few plants are found in this order. Their vegetation is various; they are at most a few inches high, and are nore or less aquatic. In Isoetes the leaves resemble those of a young rush. The organs of reproduction are always near the root, and are variable, and their nature is by no means understood. In Pilularia ( \(a\) ) it consists of a roundish head, divided internally into 1-4-cells, each cell containing small bodies of two kinds. In Isoetes (b) the fructification is even less known and understood.
2214. Isoetes. Head membranous, not opening, immersed in the base of the frond, 1-celled. Sporules angular, inserted upon many filiform receptacles.
2215. Pilularia. Heads imbricated, solitary, nearly sessile, globose, coriaceous, 4-celled. Cells containing two kinds of bodies.

History, Use, Propagation, Culture,
2214. Isoetcs. From soos, equal, and є๘оร, the year; a plant which remains the same through all the seasons, A very curious little submersed aquatic, which grows at the bottom of some of the Scotch lakes, The leaves are long and cylindrical, whence the English name Quill-wort.

Order 5.

MUSCI.

Reproductive organs of 2 kinds. Theca many-seeded, solitary, furnished with at operculum and columella. Plants leafy.
Mosses are distinguished from all other similar plants, by the peculiar nature of the reproductive organs, which are of two kinds. The principal and the most obvious is a theca ( \(a, b\) ), which is furnished with an operculum or lid (c), by means of which the sporules are retained in the theca, and a columella, or central axis, to which they are attached. The other consist of minute spherical pedicellated organs, concealed in the axils of some of the leaves, and called anthers by Hedwig. The theca is either entire, or split into four valves, as in Andreæa; when in a very young state it is enclosed in an indusium, which is torn asunder as the theca is clongated, and being carried up with it, remains upon the summit of the theea in the form of a little extinguisher called

14648 Fronds subulate half-cylindrical, Heads roundish 2-celled
14649 Filiform branched creeping, Heads brown

\section*{and Miscellaneous Parficulars.}
2215. Pilularia. From pilula, a pill. The little heads in which the reproductive organs are enclosed resemble pills. An obscure little plant found creeping among grass in meadows in many parts of England, and especially in damp places which are overflowed during winter.
calyptra (d); if the calyptra is slit up one side it is called dimidiate(d), if divided at the base into many short clefts, it is termed mitriform (e). The orifice of the theca, when the operculum is removed, is either covered by a simple membrane, or by various processes called the peristome \((f)\), either annular, or in the form of teeth, and arranged in a single or double row. These processes vary in number, and in the manner of their division; from such differences excellent characters for the genera have been obtained.
The minute attention which mosses have recelved in 1nodern times has brought their arrangement to a degree of perfection unknown in other Cryptogamic orders. This has been effected by the labor of Hooker, Greville, and Brown in our own country, and of Hedwig, Swartz, Bridel, Schwaegrichen, Palisot de Beauvois, Nees von Esenbeck, and Hornschuch abroad. The arrangement of the two last authors is chiefly adopted here from their excellent Bryologia Germanica.

With this order, the alteration in the form of our page, of which we have already spoken, commences. The columns indicating the habit, habitation in the garden, propagation, and soil, are necessarily omitted; and their place is supplied by a more extended popular character, and more detailed references to plates. The heights indicated are to be understood as in inches, and not as feet; and the colors as the general color of the plant. In the figures it has been also found necessary to represent the plants in many cases much magnified; whenever this has taken place, the figures which are larger than nature are distinguished by a * affixed to their number. The popular synonyms of this and the succeeding orders have been rendered as complete as possible, especially with reference to Sowerby's English Botany, to which valuable work this will be a complete modern index even in Cryptogamia.

\section*{Tribe I. EVAGINULATI.}

Theca entirely sessile; its receptacle stalked, and without perichatial leaves.
2216. Sphagnum. Receptacle of theca stalked. Peduncle resembling a fruitstalk. Theca sessile on the receptacle. Mouth naked.

Tribe II. Vaginulati OLOCARPI.

> Theca more or less stalked : with perichatial leaves; not valvular.
> A. Theca terminal.
> * Theca indehiscent.
2217. Phascum. Theca entire, adnate with the persistent lid. Calyptra shorter than the theca
2218. Schistostega. Fruitstalks terminal ; mouth of theca naked. Lid laciniated, with deciduous segments. 2219. Gymnostơmum. Fruitstalk terminal. Calyptra dimidiate. Mouth of theca naked.

14673 Leaves ovate apiculate patent nearly plane, Lid obliquely rostrate
14674 Leaves lanceolate serrated at the point, Thecæ ovato-oblong, Lid obliquely rostrate
14675 Leaves oblongo-obovate apiculate, Thecs ovate, Lid conical obtuse
14676 Leaves oblongo-acum. nearly plane subserrated margined, Thecæ pyriform, Lid plane submammillate
14677 Leaves ovato-acum. concave serrated not margined, Thecæ roundish obovate, Lid convex shortly rost.
14678 Stem scarcely any, Outer leaves very short ovate lanceolate: inner ones linear lanceolate; all erect obtuse with a strong nerve disappearing below the summit, Thecr oblong
14679 Stem very short, Leaves subulate straight, Theca turbinate
[subulate incurved
14680 Lvs. broadly subul, marg. invol. above flexuose crisped when dry, Thecæ ellipt, contracted at mouth, Lid

14681 Stems elongated, Leaves ovato-acuminate : those of the perichætium lanceolate, Thecæ cylindrical 14682 Stems very short, Lvs. few lin. slightly incrassated upw.: those of perichætium ovate obtuse, Thecæ ovate

and Miscellaneous Particulars.
2420. Hymenostomum. From iwny, a membrane, and soux, a mouth. This genus differs from the last in having a membrane stretched across the orifice of the theca, a character first discovered by Mr. Brown. Minute plants, with the habit of Gymnostomum.
2221. Tetraphis. The peculiar character of this genus is to have four teeth (reqge, four). The lid in the only known species of this genus is remarkably thin and scariose in texture, and the teeth are reticulated, not striated as in most mosses. The calyptra is striated or furrowed; the leaves are rigid.

History, Use, Propagation, Culture,
2222. Encalypta. From Ev , within, and *achurme, a covering or extinguisher, on account of the unusual size of the calyptra, which entirely encloses the theca; a character by which the genus may be distinguished at first sight. Small plants, forming imperfect tufts of green among moist rocks, or on mud-capped walls.
2223. Grimmia. Named in honor of I, F. C. Grimm, a German botanist, who published a Flora of Eisenach.
[Calyptra toothed at the base
14683 Stems elong. Lvs. elliptico-lanc. somew. obt. : nerve not produced beyond sum. Thecæ cylind. spiral. striat. 14684 Stems short, Leaves oblongo-elliptical obtuse: their nerve produced a little beyond the summits, Theca cylindrical smooth, Calypt. entire at the liase
14685 Stems short, Lvs. obl. acum. : nerve produced considerably bey. summ. Thecæ cylind. Calyp. tooth. at base
\& Leaves apiculate: their points of the same color, Theca smooth
\(\beta\) Leaves much acuminate: their points diaphanous, Theca smooth
14886 Leaves oblong acute : nerve as long or longer than the leaves, Theca straight striated
* Fruitstalks scarcely any.

14687 Stems branched, Leaves ovato-lanceolate recurvo-patent: their margins reflexed; the perichætial ones having their nerve disappearing immediately below their summits, Thecæ ovate sess. Lid shortly rost. \(\propto\) Leaves broad dark-green
\(\beta\) Stem long, Leaves narrow and rufous
[running beyond summits, Theca ov. sess. Lid shortly rost. 14688 Stems short pulvin. Lvs. lanc. acum, nearly erect crisp. when dry : marg. recurv.; perich. ones with nerve ** Fruitstalls longer than leaves.
14689 Stem scarcely any, Lvs. lin.-subulate crisped when dry, Theca ovate, Fruitst. geniculate, Lid rost. straight 14690 Stems short pulvinate, Leaves narrow elliptical : their margins recurved; points diaphanous piliform, Theca ovate striated, Fruitstalks curved, Lid conical acuminate
14691 Stem rather short, Lvs, ov. with long white pilifer. points, Footst. very short, Theca ov. Lid obscurely rost.
14692 Stems short, Leaves lanceolate acuminate carin. entire much crisped when dry: their margins recurved; those of the perichætium broad and convol. Theca turbinate, Lid rostrate
14693 Stems slightly branched, Leaves lanceolate-subulate gradually produced into long diaphanous hair-like points : their margin incurved, Theca ovate, Teeth of the peristome often perfora. and split, Lid rost:
14694 Lvs. lanc. subul. carin. recurv. at edge with a hair-like point, Seta curv. and flex. Theca ov. ellipt. Lid rost.
14695 Stems short, Leaves lanceolate-subulate produced into long diaphanous hair-like points: their margin incurved, Theca ovate, Teeth of the peristome quite entire, Lid shortly rostrate
* Theca with an apophysis.

14596 Lvs, lingul. rounded at top : nerve disappear. before summ. Theca obov. Apophy. obcon. Lid convex acum.

14697 Leaves ovato-lanceolate acute, Theca (with the apophysis) narrowly pyriform, Lid nearly plane
** Theca destitute of an apophysis.
1. Leaves ovate or lanceolate.

14698 Stems scarcely any, Leaves ovato-lanceolate nerveless, Theca ovate gibbous on one side cernuous
14699 Stems elongat. Lvs. lanc. acum. Theca obovate cernuous gibbous sulcate, Lid hemispheric. obtusely point. 14700 Stem simple short, Leaves broad and bluntly ov, with a short point imbric. Nerve shorter than leaf, Theca 14701 Stems very short, Lis. ov. with an excurr. nerve, Theca ov. erect, Lid conical, Teeth of perist. subul. acute

14702 Stems very short, Lvs. ov. with an excurr. nerve, Theca ov. erect, Lid conic. Teeth of perist. subulate acute 14703 Stems somew, elongat. Lvs. ov. with an excurr. nerve almost piliferous, Theca ovate, Lid obliquely rostrate

> 2. Leaves linear or subulate.

14704 Leaves linear denticul. crisped when dry, Theca ovato-turbinate sulcate erect, Lid obliquely subulate
\& Leaves linear-subulate subserrulate
\(\beta\) Leaves broad-linear denticulate
14705 Stems scarcely any, Leaves subulato-setaceous entire, Theca ovate striated, Lid rostrate
14706 Leaves broadly subulate crisped when dry : their margins recurved, Theca ovate, Lid rostrate

\section*{14707 Leaves linear-subulate, Theca ovate cylindraceous, Lid rostrate}

14708 Stems divid. Lvs. from a broad base lanc.-subul. crisp. when dry : marg. incurv. Theca ov. ellipt.Lid rostrate. 14709 Stems nearly simple, Lvs. lin.-subul, crisp. when dry : their marg. incurv. Theca ovato-ellipt. Lid rostrate 14710 Stems scarcely any, Lvs. from a broad base lin. obt. thick with a very broad nerve, Theca turbin. Lid rost. 14711 Stems scarcely any, Leaves subulate, Theca broadly ovate, Fruitstalks curved, Lid rostrate

and Miscellaneous Particulars.
Plants growing in roundish tufts, and nearly related to Trichostomum. G. pulvinata is the moss which forms those little cushion-like dark brownish green lumps which are so commonly spotted over the tops of old walls and houses.
2224. Weissia. In honor of J. W. Weiss, a German cryptogamic botanist. There was also a John 3 M 3

History, Use, Propagation, Culture,
Christopher Weiss, who published, in 1712, a Dissertation on the pomegranate. These plants are chiefly found in wet places, most frequently in alpine countries; in habit they resemble Gymnostomum.
2225. Dicranum. Named by Hedwig, from \(\delta\) ixecsos, forked, in allusion to the division of the teeth. This is one of the finest genera of mosses, containing many species which form broad masses of turfy vegetation, giving a decided character to the face of the earth where they grow. Like most of the genera of this order,

which give them the appearance of being hoary. The genus is nearly related to Grimmia both in natural and essential characters.
2227. Cinclidotus. Sc called from xuyx ciliæ of the peristome are united in parcels. A plant from four to six inches long, growing on stones and wood in streams of water, in many places exceedingly common. Its general appearance is that of Trichostomum, whilst the peristome more resembles that of a Tortula.
2228. Tortula. From torqueo, to twist, in allusion to the singular manner in which the teeth of the peristome are twisted together. Small plants, frequently forming thick tufts, and common in almost all situations from

14761 Stems irregularly branched curved, Leaves ovate subacuminated concave : their margins recurv. serrated; nerve single or forked : shoots faint, Lid conical

14762 Stems scarcely branched, Leaves lanceolate acuminate carinate: their margins recurved entire, Theca ovato-cylindraceous oblique substrumose furrowed when dry, Lid conical

14763 Leaves bifarious from a sheathing base subulate, Theca ovate inclined, Lid conical
14764 Leaves obovate shortly apiculate: their nerve incrassated above, Theca ovate erect, Lid shortly rostrate 14765 Stems more or less elongat, Lvs, oblon,-ov, flexu. strongly serrat at point, Theca erect cylindrac. Lid rost.
14766 Leaves closely imbricated on all sides lanceolate much acumin. carinate with the rigid nerve running beyond the point, Theca oblongo-ovate erect, Lid rostrate
14767 Leaves rather distant somewhat trifarious lanc. rather obtuse carinated with the nerve scarcely reaching to the point, Theca oblongo-ovate erect, Lid rostrate

and Miscellaneous Particulars.
the banks of the sea-shore to the limits of perpetual snow. The character from which the genus has received its designation, will always indicate the species with perfect truth.
2229. Pterogonium. A name altered by Swartz from the Pterigynandrum of Hedwig, which was contrived to express that the male and female flowers of this genus of mosses are both present on a pinnated stem. An elegant collection of species, generally found in subalpine countries, where they enliven the trunks of trees and rocks with their bright green trailing entangled stems, which have altogether the habit of Hypnum. \(\mathbf{P}\). Smithii has only been found in this country upon trees in the southern counties, especially in Devonshire.
2230. Didymodon. So called, by Hedwig, from \(\delta \delta \delta \nu \mu \circ s\), double, and \(0 \delta \delta_{5}\), a tooth, in reterence to the geminate

History, Use, Propagation, Culture,
arrangement of the teeth of the theca. In natural habit, the plants of this genus approach on the one hand to Weissia, and on the other to Dicranum. With the former, Dr. Hooker observes that two species are liable to be confounded, viz. Didymodon inclinatum, and D. heteromallum, each of which has but sixteen teeth, and their approximation in pairs is with difficulty discoverable. D. inclinatum is a very rare plant, having been scarcely found any where in this country, except upon the mountains of Cunnemara, in Ireland.
2231. Splachnum. Emharxvoy was one of the Greek names of moss. Generally elegant little plants, with thecæ of exquisitely beautiful forms. The annual species are usually found growing upon dung, while the perennial are found in more permanent situations. They are in all cases of rare occurrence. S. Frelichianum was found on the summit of Ben High, in the Scotch Highlands.
2932. Conostomum. From *wvos, a cone, and souж, a mouth, the teeth of the theca being always united at

14768 Stems elongated, Leaves nearly distichous subulato-setaceous, Theca erect ovato-cylindrace. Lid conical

and Miscellaneous Particulars.
the points. A curious genus, first established by Swartz, in Schrader's Journal. The British species approaches in habit to Bartramia fontana. It is quite an alpine plant, not growing in Switzerland at a Iower elevation than 7 or 8000 feet. With us it inhabits the summits of the highest Scotch mountains, particularly in the Breadalbane district. 2233. Orthotrichum. From ogios, straight, and \(9 \rho \cdot \xi \tau \rho \% 05\), hair, on account of the straight, not twisted direction of the teeth of the peristome. No genus can be more natural than this, notwithstanding some variations in the peristome of some of the species from the ordinary structure. Thus \(\mathbf{O}\). decipiens and anomalum have no ciliary processes; and 0 . striatum has them of a peculiar shape and beaded appearance. Many of the plants referred to this genus are common occupants of the aged trunks of trees, where they vegetate among the soft earth which collects in the clefts of the dead bark. O. Lyellii, which is the finest of our species, is only found on trees in the New Forest.

History, Use, Propagation, Culture,
2234. Zygodon. From suras, a yoke, and oiss, a tooth, and so called, we presume, in allusion to the yoking together by pairs of the outer teeth; but the name is unexplained by its authors. A singular plant, which was referred to Bryum by Dickson, and to Mnium by Smith. The stems grow in a tufted manner like Gymnostomum viridissimum, but rarely exceed half an inch in length. The peristome is double ; the outer consisting of sixteen short obtuse teeth approaching in pairs, which at length become recurved; inner of as many alternate ciliæ lying horizontally over the mouth of the theca.
2235. Diphyscium. From \(\delta 65\), twice, and \(\varphi v \sigma z o v\), a vesicle, in allusion to the double nature of the shell of the theca. A little plant found in woods, and on rocks in alpine situations. The stems are exceedingly short, and grow in densely matted patches. The theca is large, ovate, gibbous, and oblique. Dr. Hooker denies the existence of a double peristome, while Hornschuch asserts its presence.
2236. Buxbaumia. A very singular plant, destitute of apparent leaves, and resembling a minute fungus rather than a moss, It was named in honor of John Christian Buxbaum, a German botanist, who published, in 1728, an account of the plants of Asia Minor in five centuriæ of figures of little merit.. This plant was originally discovered in the vicinity of Astrachan, afterwards in a fir-wood near Norwich, and lately in two stations in Scotland. Its minute size and want of foliage may have caused it to be overlooked.
2237. Funaria. From funis, a rope, in allusion to the twisted nature of the strongly hygrometrical fruitstalk. This genus, though sufficiently characterized by the interior teeth or ciliæ being oblique and placed

opposite to those of the outer, is further remarkable in these teeth lying horizontally over the mouth of the theca, In the male flowers of Hedwig, the succulent filaments are remarkably clavate, jointed, pellucid, the joints containing greenish granules. Funaria hibernica has been found only on the roof of a thatched cottage at Blarney, near Cork, Ireland. The long flexuose fruitstalk of F. hygrometrica, one of the commonest of mosses in almost every situation, possesses strong hygrometrical qualities.
2238. Bartramia. So called in honor of John Bartram, an Anglo-American, to whose researches in North America the gardens of Europe owe many of their finest trees. He had a son William, who published in 1773, an account of a journey in the interior of North America. This is an elegant genus of mosses, remarkable for their fine capillary light green leaves, and spherical capsules. The genus approaches nearly to Bryum, but differs in almost every species having a spherical capsule; and the sixteen broad segments of the inner peristome, instead of being entire or only perforated, are cleft like the teeth of a Dicranum.
2239. Pohlia. Named in honor of I, E. Pohl, a German botanist. Small plants, often refered to Bryum, with which they entirely agree in habit.
2240. Bryum. One of the ancient Greek names of moss. These are all dwarf plants producing capsules in abundance, and generally found growing in wet places. In B. palustre are found terminal capitular bodies which much resemble what are called the anthers of B. androgynum ; but in B. palustre they are considered gemma, and arise not only from the main stem 8 , but also from the innovations. B. triquetrum has only been

History, Use, Hropagation, Culture.
found in Great Britain upon the borders of some lake in the north of Ireland. By Mohr it is considered is distinct genus, and called Diplocomium.

\section*{A. Exterior peristome shorter than interior}

14811 Stems somew. branch. Lvs. lin. obt. ent. reticulat. Theca obovate recurved subcernu. Fruitstalk very long 14812 Stems branched, Leaves ovate cuspidate reticulated shorter than nerve, Theca curved pyriform pendulous 14813 Stem elongat, branch. Lvs, lanc, carin, ac, serrated reticulat. Theca pyrif, erecto-cernu. Fruitst. very long 14814 Stems short, Leaves lanceolate acute plane serrated at the points reticulated, Theca pyriform nearly erect
B. Peristomes equal.
§1. Leaves without a thickened margin.
14815 Stems slightly branched, Leaves subul.-setaceous fexuose serrated: nerve very broad, Theca pyrif. pendul.
14816 Stems branched, Leaves closely imbricated broadly ovate concave entire obtuse : nerve running nearly to the point, Theca obovato-cylindraceous pendulous
14817 Stems simple, Leaves rigid lanceolate : the upper ones the narrowest and longest ; all of them plane serrul. nerve disappearing below the summit, Theca oblong-subpyriform cernuous
14818 Stems simple, Lvs. lane. reticulat. slightly serrul. at point; nerve disappear, bel, summ. Theca obov, pendul.
14819 Stems branched, Leaves closely imbricated broadly ovate suddenly and sharply acuminated subserrulate very concave: nerve disappearing below the point, Theca ovato-pyriform pendulous
14820 Stems branch. Leaves closely imbricated more or less broadly ovate acuminulate very concave reticulated entire: nerve running nearly to the point, Theca clavate cernuous
14821 Lvs. obovato-spathulate acute serrated undul. : nerve running to the point, Theca oblongo-ovate pendul. 14822 Stems short, Leaves obovate twisted when dry entire: their nerve produced into a hair-like point; their margins slightly thickened, Theca oblong pendulous
14823 Stems short, Lvs. erect lanc. acuminated serrated above : nerve reach. to point, Theca oblon.pyrif. pendul.
14824 Stems rig. elongat. branch. Lvs. closely imbricat. erect lanc. somew. obt. subserrul. at apex : marg. revolute; nerve reaching to the points, Theca oblongo-ovate pendulous

\section*{82. Leaves with a thickened margin.}

14825 Stems elongated, Leaves obovato-rotundate very obtuse reticulated; their margins thickened entire; nerve disappearing below the point, Theca ovate pendulous, Lid shortly rostrate
14826 Stems elongated, Leaves undul. ligul, reticulated: their margins thickened denticul, ; nerve reaching a little beyond the point, Theca ovate pendulous, Lid conical
14827 Stems elongated, Leaves broadly ovate reticulated: their margins thickened denticulated; the nerve reaching a little beyond the point, Theca ovate pendulous, Lid rostrate
14828 Stems elongated, Leaves ovate acute reticulated : their margins thickened serrated; nerve reaching a little beyond the point, Theca ovate pendulous, Lid shortly rostrate
14829 Stems clongated, Leaves lanceolate acute reticulated : their margins thickened denticulate; nerve generally disappearing below the summit, Theca oblongo-ovate pendulous, Lid hemisph. mucronulate
14830 Stems elongated, Leaves obovate acute reticulated : their margins thickened denticulated above; nerve running beyond the point, Theca ovate pendulous, Lid conico-hemispheric. obtuse
* Calyptra naked.

14831 Lvs. lanc. undul. : their margins plane denticulat.; their nerve winged, Theca cylind. curved, Lid subul. 14832 Lvs. lanc. rig. ent. : their sides invol. ; their nerve broad impress. with furr. Theca obl suber. Lid conical ** Calyptra hairy.
14833 Leaves lanceolate-subulate : their margins involute ent. terminating in a pellucid hair-like point, Theca ovate obtusely quadrangular furnished with an apophysis, Lid conical
14834 Leaves lanceolate-subulate : their margins involute entire; their points acumin. colored subserrated, Theca ovate obtusely quadrangular furnished with an apophysis, Lid conical
14835 Leaves lineari-subul. obtuse: their margins especially towards the top invol subserrulate, Theca ovate subangulate furnished with a minute apophysis, Lid conical acuminate
14836 Stems elongated, Leaves patent lineari-subulate: their margins plane serrated as well as the points of the keels, Theca erect ovate quadrangular with an evident apophysis
\& Leaves with their margins of the same color
\(\beta\) Leaves shorter with their margins pellucid
14837 Stems elongated branched, Leaves patent subulato-lanceolate: the margins plane serrated as well as the points of the keels, Theca subovate with an indistinct apophysis
14838 Stems elongated brauched, Leaves erecto-patent lanceolate acute: their margins plane serrated, Theca erect cylindrical destitute of an apophysis
14839 Stems short, Leaves linear-lanceolate obtuse: their margins plane serrated principally at the extremity and at the summit of the keels, Theca nearly erect cylindrical without an apophysis
\(\propto\) Fruitstalks 2 inches long, Stems simple
B Fruitstalks very short, Stems branched

and Miscellaneous Parliculars.
2241. Polytrichum. From toivs, many, and 9 ge rgoxos, hair, on account of the numerous hairs of the calyptra, Easily distinguished by the rigidity of the leaves and the square form of the theca, which is gene-

History, Use, Propagation, Culture,
rally covered by a very hairy calyptra: this organ is in some species smooth, by which character they have been distinguished by the accurate Ehrhart, under the name or Catharinea; but Dr. Hooker is of opinion that the genus is not tenable.
2242. Anictangium. From aveseros, open, and ayrtiov, a vase, on account of the open nature of the theca, which is not enclosed by a peristome. The only British species are two plants with nerveless leaves, and the habit of Trichostomum.
2243. Fissidens. From fissus, split, and dens, a tooth, in allusion to the structure of the peristome. Plants generally referred to Dicranum by British botanists, but differing from that genus entirely in habit, and sufficiently in characters. Dr. Hooker remarks, that the structure of their leaves is highly curious, and totally unlike that of any other plant with which he is acquainted. Besides being vertical, their upper half (taking the nerve for the line of separation) is, from the base beyond the middle, composed of two equal lamelize, the lower part of which embraces the stem, and the rest very often embraces a portion of the leaf placed immediately above it.
2244. Leucodon. Named from \(\lambda\) kuxos, white, and osus, a tooth, from the color of the peristome. The only British species has occasionally been thrown among the Dicrana, Trichostoma, and Pterogonia; from any of which, an attentive consideration of the lateral fruit, deeply divided teeth, and dimidiate calyptra, will keep its genus distinct. The stems are long, and creeping over the bark of trees.
2245 . Fontinalis. From fons, a fountain, in allusion to the places where it grows. F. antipyretica is a common plant, floating in large masses in rivers and pools of water. The specific name was given it because

14840 Stems short, Lvs. lin. lanc. : marg. serrat. principally at extrem, as well as summit of keels, Theca nearly [erect subglobose

14841 Leaves ovate much lengthened out and diaphan. at points: those of perichætium laciniated at extremity 14842 Leaves ovato-acuminate colored at the points: those of the perichætium serrated at the extremity

14843 Fruitstalks terminal, Perichætial leaves resembling the cauline ones

14844 Like the last, but theca drocping
14845 Fruitstalks lateral, Perichætial leaves ovate slightiy convolute pointed
14846 Fruitstalks radicular, Perichætial leaves ovate sheathing involute pointed

14847 Leaves closely imbricated ovate-cordate acuminate striated, Theca oblong

14848 Leaves nerveless for the most part complicato-carinate
14849 Leaves nerveless plane or very slightly concave
14850 Leaves furnished with a nerve slightly concave
14851 Lvs. ov. acum. serrul. : the nerve disappear. below point, Fruitst. twice as long as perichætium, Theca ov. 14852 Leaves ovato lanceolate obtuse entire : the nerve reaching to the point, Fruitst. very long, Theca cylind.

14853 Lvs. ovato-acum, slightly conc. : marg. recurv. Fruitst. scarcely longer than perichæt. Ivs. Theca oblon.-ov. 14854 Leaves oblong acuminulate transversely rugose, Fruitstalks much exserted, Theca ovate
14855 Lvs. bifar. ov. lanc. transversely undul. serrul. at peint, Theca ovate subsess. shorter than perichætial lvs.
14856 Leaves oblongo-lanceolate, Fruitstalks long, Calyptra fimbriated at the base
14857 Leaves broadly ovate acute, Theca sessile impressed, Calyptra nearly entire
148.58 Leaves broadly ovate entire obtuse nerveless

14859 Lvs, ov. acuminul. margin. very obscure. serrat. at extrem. with 2 nerves nearly reach. their whole length
14860 Lvs. broadly scymitar-shaped serrat. at point : nerve reach. to middle of leaf, Theca ovate erect, Lid rost. 14861 Leaves oblong apiculate entire nerveless, Theca ovate erect, Lid rostrate

and Miscellaneous Particulars.
it is employed by the Swedes to fill up the spaces between the chimney and the walls, and thus, by excluding the air, to prevent the action of fire.
22*6. Anomodon. So called by the authors of Muscologia Britannica, on account of the peculiar nature of the peristome, which has narrow fringed processes arising from the very same range, and from between the teeth; cyopos, irregular, and oiss, a tooth. The stems are dark, almost blackish green, long, cylindrical, and straggling. It is not uncommon on the wilds of Dartmoor.
2247. Neckera. Named after N. J. Necker, a German botanist, who published in 1791, his Elements of Botany, a work which contained more useful imformation than many of his detractors have been pleased to allow. Beautiful mosses, found in woods and upon trees and rocks. N. crispa has more the appearance of some fine tropical moss, than of those of our own country, where it is far from uncommon in mountainous districts, frequently covering a great extent of surface upon the trunks of old forest-trees.
2248. Daltonia. Named in honor of the Rev. James Dalton, a skilful English muscologist. The mitriform calyptra separates this from Neckera. D. splachnoides has only been found by the side of a streamlet on the Secawn mountain, near Dublin, where it grows sparingly in pale green tufts.
2249. Hookeria. This beautiful Hypnum-like genus was named by Sir James Edward Smith, in honor of Dr. William Jackson Hooker, F. R. S., \&c. professor of botany in the university of Glasgow, one of the most distinguished of modern cryptogamic botanists, and a gentleman whose public reputation is only exceeded by his private excellence. The Hookera of Salisbury, must give way to this on every account. H. læte-virens has hitherto been discovered only in a bog near Cork.
2250. Leskea. N. G. Leske was an obscure German botanist, of whom little is known, except that he gave

occasion to Hedwig to name this genus after him. It has entirely the habit of the next, with which it is frc. quently united.

14362 Leaves ovate obtuse concave entire : nerve reaching to the summit, Theca cylirid. nearly erect, Lid conical

\section*{14863 Leaves closely imbricated rotundato-ovate obtuse very concave ventricose nerveless, Theca ov. nearly erect}

14864 Leaves loosely imbricated: the upper ones subsecund; all of them lanceolate acuminate entire nerveless, Theca ovato-cylindrical nearly erect, Lid conical.
14865 Lvs, erecto-pat, lanc. acuminat. ent. striat. faintly 2nerved at base, Theca ovate nearly erect, Lid conical
14866 Leaves erecto-patent lanceolate acuminated entire striated; nerve running to three fourths of the length, Theca ovate cylindrical erect, Lid conical
14857 Stems erect below simple and naked fascicled above, Leaves ovate more or less lanceolate striated serrat. at the point: nerve reaching nearly to the summit, Theca erect ovate cylindrical, Lid rostrate
14868 Stems variously branched procumbent, Lvs, all of them slightly secund broadly ovate with an attenuated obtuse point: nerve running nearly to the summit, Theca ovate cernuous, Lid conical

14869 Leaves 1-sided imbricated erect spreading ovate lanceolate acum. entire obscurely 2 nerved at base, Fruitst. numerous, Theca erect ovate, Lid acutely conical

\section*{* Stems plane.}

14870 Lvs, ov.-lanc. acuminat. ent. : the nerve reaching nearly to summit, Theca oblong cernuous, Lid conical 14871 Lvs. ov. ac. transversely undulat. with two faint nerves at base, Theca obl. furrow. arcuato cern. Lid rost. 14872 Leaves ovate sometimes approaching to lanceolate more or less acuminated having two short nerves at the base, Theca oblongo-cylindraceous inclined, Lid conical
\(\propto\) Leaves ovate lanceolate distant quite plane
\(\beta\) Leaves ovate more or less obtuse slightly concave

> ** Leaves spreading on all sides of the stem.

14873 Lvs, fascicul, erect lanceolato-subul, ent. : nerve reaching to summit, Theca ovate cerntous, Lid rostrate 14874 Leaves ovato-lanceolate rather obtuse patent entire: their nerve for the most part reaching to the summit, Theca cylindrical curved cernuous, Lid conical
14875 Leaves lanceolate acuminated serrated: margin slightly reffexed: nerve reaching to the point, Theca ovate nearly erect, Fruitstalks rough, Lid conical
14876 Leaves cordato-acuminate serrated: their nerve reaching to the point; their margin slightly reflexed, Theca ovate cernuous, Fruitstalks rough, Lid conical
14877 Leaves loosely imbricated rotundato-ovate obtuse concave entire faintly two-nerved at the base or with one short nerve, Theca ovate cernuous, Lid conical
14878 Leaves closely imbricated nearly erect elliptical apiculate concave entire faintly two-nerved at the base, Theca ovate cernuous, Lid conical
14879 Leaves subpatent ovate subacuminated papillose on the back and margin with a very short nerve, Theca ovate inclined, Lid conical acuminated
14880 Leaves loosely imbricated erecto-patent oblongo-ovate obtuse entire: their nerve reaching half way, Theca oblongo-ovate curved cernuous, Lid conical
14881 Leaves nearly erect imbricated oval with a very short point concave entire: nerve reaching about half way up, Theca ovate cernuous, Lid rostrate
14882 Leaves closely imbricated oval with a very short point very concave : their nerve reaching half way up, Theca ovate cernuous, Lid conical
14885 Leaves loosely imbricated, the upper ones falcate secund; all of them lanceol.-subul. scarcely serrated at their points : their nerve reaching more than half way, Theca ovate obl. curved cernuous, Lid conical
14884 Leaves erecto-patent ; the upper ones sometimes secund; all of them ovato-lanceolate acuminated sulserrated: the nerve reaching above half way, Theca ovate cernuous, Lid conical
14885 Lvs, nearly erect lanc. acum, serrul, tow. end : nerve disappear. beyond end, Theca cern. Lid acute conical 14886 Leaves erecto-patent lanceolate acuminated entire striated: nerve disappearing below the point, Theca ovate cernuous, Fruitstalks rough, Lid conico-acuminated
14887 Leaves erecto-patent harrow lanceolate acuminated nearly entire striated: nerve running nearly to the summit, Theca oblongo-ovate curved cernuous, Fruitstalks smooth, Lid conical
14888 Leaves erecto-patent ovato-lanceolate acuminated striated entire: nerve reaching half way up, Theca ovate cernuous, Fruitstalks smooth, Lid conical
14889 Stems erect below simple and naked, fascicled above, Leaves concave ovate ellipt. acute serrated: nerve running nearly to the point ; marg. reflexed, Theca ovate cernuous, Lid rostrate
14890 Branches fascicled curved, Leaves ovato-elliptical concave serrated at the points : nerve disappearing beyond the middle, Theca ovate erect, Lid rostrate
14891 Stems tripinnate, Leaves ovate with a suddenly acuminated serrated point concave faintly two-nerverl at the base: margin below recurved, Theca ovate cernuous, Lid rostrate
14892 Stems tripinnate, Leaves serrated papillose on the back: the cauline ones cordato-acuminate striated with a nerve running nearly to the point ; those of the branches more ov. with a silig. or doulle nerve at base 11893 Stems subbipinnate, Leaves distantly placed patent cordate or ovate acuminated serrated: nerve disappearing below the summit, Theri ovate cernuous, Lid rostrate

and Miscellaneous Particulars
2251. Hypnum. One of the names of moss among the Greeks was ívoy. This is the most extensive genus among mosses, and is readily known by its prostrate pinmated bright green branches, which form thick mat-

14894 Stems pinnate (or irregularly bipinnate), Leaves thickly set cordato-acuminate serrated very faintly twonerved at the base, Theca oblong cernuous, Lid conical
14895 Stems pinnate, Leaves serrated papillose on the back: the margins reflex. ; nerve running nearly to the point ; the cauline ones cordato-acuminate : those of branches cord. ac. Theca cylind, inclined, Lid rost.
14896 Stems pinn. Lvs. serrated smooth on the back: marg. reflexed; cauline ones cordato-acute with a short nerve, those of branches ovate acum. with nerve disappear. bey. midd. Theca cylind. inclin. Lid conical
14897 Stems somewhat pinnate, Leaves ovate with a long narrow acunaination serrated : nerve disappearing below the middle, Theca ovate cernuous, Lid rostrate
14898 Stems variously branched, Leaves patent ovate acuminated serrated at the points striated: their nerve reaching half way, Theca ovate cernuous, Fruitstalk rough, Lid conical
14899 Stems variously branched, Leaves erecto-patent ovate often approaching to lanceolate acuminat. serrated striated: nerve reaching half way, Theca ovate cernuous, Fruitstalks rough, Lid conical
14900 Stems pinn. Branches short erect, Lvs. all recurv, cord, acum, obsol 2-nerv. at base, Lid obtusely conical 14901 Stems somewhat pinnate, Leaves serrulate two-nerved at base : primary cordate acuminate; of branches broad ovate, Theca ovate cernuous, Lid conical
14902 Leaves loosely set squarrose cord, much acuminated ent. nervel. Theca oblongo-ov. curv, cern, Lid conic.
14903 Leaves recurved squarrose lanceolate much acuminated concave serrated striated faintly two-nerved at the base, Theca globoso-ovate cernuous, Lid conical
14904 Leaves loosely imbricated spreading broadly ovate acute serrated concave with a nerve nearly as far as the middle, Theca ovate cernuous, Lid rostrate
14905 Lvs, spread. cord.-acum. serrat. striat. : nerve reach, beyond midd. Thecs obl. ovatecernu. Fruitst. smooth 14906 Lvs, erect. spread, ov. acum. concave serrat. : their nerve reach. half way, Theca ov. cernu. Fruitst. smcoth
14907 Leaves loosely set ovate concave nerveless entire : lower squarrose ; upper imbricated in a cuspidate point Theca oblong curved cernuous
1908 Lvs. loosely set squarr, cord.-ov, obt. concave ent. : nerve running nearly to point, Theca obl. curv. cernu 14909 Lvs. loosely set squarr, cord. much acum. entire: nerve disappear. half way up, Theca obl. ov. curv. cernu. 14910 Lvs. squarr. cordato-acum. serrat. faintly striated with two nerves at base, Theca globoso-ov. Lid conical 14911 Leaves squarrose widely cordate very much acuminated and recurved serrated faintly two-nerved at the base, Theca ovato-globose cernuous, Lid conical

> *** Leaves secund.

14912 Stems subpinnate, Leaves especially the upper ones falcato-secund broadly ovate acuminated serrated: their nerve reaching to the point, Theca oblongo-ovate curved cernuous, Lid conical
14913 Leaves secund ovate somewhat acuminate concave entire: margins incurved above; nerve short often forked sometimes obsolete, Theca oblongo-ovate cernuous, Lid conical

14914 Leaves falcato-secund lanceolato-subulate concave or almost semicylind, entire: the nerve disappearing below the summit, Theca oblongo-ovate curved cernuous, Lid conical
\(\beta\) Leaves wider less falcate
[cernuous, Lid conical
14915 Lvs. falcato-secund lanceolato-subul. serrat. striat. : nerve disappearing below point, Theca cylind. curv. 14916 Lvs. sec, ovato-lanc. serrat, nearly plane crisp. transverse. when dry : marj. recurv. ; nervereach. half way 14917 Stems pinnated, Leaves falcato secund cordate very much acuminated serrated: their margins reflexed; nerve disappearing below the summit, Theca oblongo-ovate curved cernuous, Lid conical
14918 Leaves secund broadly ovate ventricose obtuse ent. nervel. Theca oblongo-ovate curv. cernu. Lid conical 14919 Leaves loose!y imbricated secund narrow-lanceolate acuminated serrated nerveless or very obscurely twonerved, Theca subcylindrical erecto-cernuous, Lid conical obtuse
14920 Leaves closely imbricated more or less falcato-secund lanceolate acuminated entire, except at the points, which are usually serrated very faintly two-nerved at base, Theca cylind. erecto-cernuous, Lid conical

14921 Stems closely pectinated, Leaves falcato-secund ovato-lanceolate acuminated serrulate striated faintly two-nerved at the base, Theca oblongo-ovate curved cernuous, Lid conical
14922 Stems pectinated, Leaves falcate secund cordate acuminated serrated not striated faintly two-nerved at base, Theca oblong ovate curved cernuous, Lid conical

VAGINULATI SCHISTOCARPI.
14923 Stems branched, Leaves obovate suddenly acuminate straight imbricating the stem on every side 14924 Stems branched, Leaves ovate gradually acuminated: the upper ones falcate
14925 Stems almost simp. Lvs. lanc. subul. falcate secund fragile : perichætial obl. nervel. ; their marg. involute 14926 Stems slightly branched, Leaves loosely imbricated lanc. subfalcate secund: perichætial similar to cauline

and Miscellaneous Particulars.
named Andreas, who was cited honorably by Pliny. This remarkable genus differs from all other mosses, in having a theca which splits into four valves, cohering at their ends by ineans of the persistent lidi ; it agrees with Sphagnum in having no fruitstalk, but in its room an elongated receptacle, and appears to be a transition from Musci to Hepaticæ. This is, however, only apparent. All the species ale natives of rocks or mountains, and are remarkable for their nearly black or dark brown color.

Reproductive organs of two kinds. 1. Thece without an operculum, either naked or sessile, or furnished with a veil through which they are more or less protruded. Sporules naked (e), or mixed with spiral threads ( f ). 2. Minute roundish or oblong bodies variously situated. Plants frondose of a cellulose structure not submersed.

This order is distinguished from Algæ, with which it was formerly united, by the nature of the theca ( \(a, b\) ), and of the foliaceous frond (c) which is never submersed, and which bears a greater affinity to that of Musci. From

\end{tabular}
these Hepaticæ differ in being destitute of an operculum or lid to the theca, and, with the exception of Marchantia (d) and Jungermannia, of a calyptra. The order is composed of seven genera, all very different from each other, and forming an assemblage which is only natural in regard to the organs of vegetation. It does not appear possible to reconcile those of reproduction. The herbage consists of a variously dilated frond lying flat upon the substance on which it grows, generally naked, but in many Jungermannias covered with small leaves, which are often divided, but never really nerved, so that, in fact, they should rather be considered dilatations of the frond: the substance is generally loosely cellular, sometimes compact, as in Marchantia, in which Hooker asserts that pores of the epidermis exist.
2253. Jungermannia. Theca 4-valved, supported on a peduncle longer than the calyx. Valves free.
2254. Marchantia. Theca on the under surface of a common peltate pedunculate receptacle. Anthers imbedded in the disk of distinct peltate pedunculate or sessile receptacles.
2255. Riccia. Theca_spherical, immersed in the frond (not opening), crowned with the style, which is alone protruded.
2256. Anthoceros. Theca stalked, linear, 2-valved, with a central columella to which the sporules are attached.
2257 Targionia. Perianth? globose, arising from the underside of the extremity of the frond, at length opening vertically into 2-valves. Theca globose, nearly sessile, included in the perianth, opening irregularly at the extremity, and filled with spiral filaments.
2258. Sphcerocarpus. Thecæ minute, spherical, seated upon obpyriform receptacles, and filled with minute sporules unmixed with filaments.

bourhood of Altdorf, and a work called Cormucopia Floræ Giessensis, A genus of obscure plants, forming by their creeping stems little patches upon trees or rocks, or on the earth in damp places. The British

14951 Stem procumbent flexuose branched in a starry manner, Leaves broad-ovate acutely 2-parted : segments folded together with spiny teeth, Fruit terminal
14952 Lvs. subquad. acutely bifid : segm. acute straight ent. Fruit terminal, Cal. obl. plaited: mouth tonthed
14953 Leaves subquadrate obtusely bifid: segments acute, Fruit terminal, Cal. oblong plaited: mouth toothed 14954 Lvs. orbicul. concave at extrem. lunul. emarg. Fruit term. upon short prop. central branches. Cal. obl. ov. 14955 Lvs. round. very conc. bif. : segm. long acum. incurv. Fr. term. upon short prop. branch. Cal. obl. subplicate

> c Leaves 3-4-fid : segments equal.

14956 Stem prost. nearly simp. Lvs, round. square : lower bifid; upp. 3-4-fid, Fr. term. Cal. obl. ov. somew. plait. 14957 Leaves subquadrate waved subtrifid; segm. equal here and there toothed, Fruit terminal, Cal. obovate 14958 Leaves spreading horizontally quadrate waved obtusely bitricrenate, Fruit terminal, CaL campanulate, Theca spherical bursting irregularly
14959 Leaves bifarious closely imbricated erect quadrate quadrifid: their inferior angles here and there spinul. toothed, Fruit terminal and lateral, Cal. oblong plicate : the mouth open
d Leaves bifid: segments unequal folded together.
14960 Lvs. unequally 2 lobed \(\frac{x}{8}\)-bifid tooth cili. Lobes fold. together: lower ones larger obov.; upp. subcord. obt. 14961 Stem erect nearly simple, Leaves unequally 2 -lobed as deep as base : tooth ciliated, Lobes folded together 14962 Lvs. uneq. 2-lob. Lobes folded together serrated at extrem. acute: lower ones larger ov.; upp. round. ov. 14963 Leaves unequally 2-lobed wavy entire, Lobes roundish folded together; lower ones largest, Fruit term. Cal. oblong incurved compressed
14964 Leaves roundish nearly equally 2 -lobed entire, Lobes folded together, Fr, term. Cal, obl. incurv. compres. 14965 Leaves unequally 2lobed folded together with a pellucid line in the middle serrated at the extremity, Fruit terminal, Cal. obovate cylindrical
14966 Lvs. unequally 2 -lobed folded together obtuse entire, Fruit term. Cal. obov. : mouth contracted toothed 14967 Lvs. unequally 2 -lobed folded together narr. ov. acute, Fr. term. Cal. ov. plaited : mouth contract. toothed 14968 Leaves horizontally spreading somewhat folded together: upper equally, lower unequally 2-lobed, All the lobes rather acute, Cal obovate
14969 Stem prostrate nearly simple, Leaves unequally 2-lobed, Lobes folded together: lower larger ovate concave acute; upper minute tooth-like
14970 Leaves imbricated on the upper side unequally 2-lobed folded together : upper lobes the larger convex bifid and toothed at the extremity
14971 Lvs, distich. imbricat. above unequ. 2-lobed : upp. lobes larger orbicul. ; lower ov, appres. flat, Cal. truncat.
\[
\dagger+\text { Furnished with stimules. }
\]
* Leaves entire or rarely emarginate.

14972 Leaves orbicular and ovate acuminate, Stipules broadly subulate
14973 Lvs. all rounded, Stip. broadly subul. Fruit term. Cal. ovate compressed at the extremity truncate 2-lipped 14974 Lvs. round concave entire and emarg. Stipules broadly subul. Fruit terminal, Cal. immersed in the leaves 14975 Lvs. horizontal rounded quad. plane ent. and emarg. Stip. obl bifid, Fr. upon very short proper branches 14976 Stem creeping simple, Lvs. rather rem. cuneiform ent. or bluntly emarg, at end, Stip. minute ovate bifid 14977 Leaves horizontal plane ovate entire, Stipules broadly ovate toothed lanc. Fr. lat. Cal. subterr. obl. fleshy 14978 Leaves horizontal convex ovate ent. Stipules round lunate-emarg. Fruit lat. Cal. subterr, obl. fleshy hairy
\[
\text { ** Leaves } 2 \text { or } 3 \text { cleft : segments equal. }
\]

14979 Leaves broadly ovate decurrent bitid at the apex : segm, very acute entire, Stipules bitrifid and laciniate 14980 Stem creeping branched, Leaves round-ovate decurrent rarely acutely often obtusely emarginate or entire, Stipules bitrifid, Fruit terminal, Cal. ovate
14981 Leaves round acutely emarginate : segments acute straight, Stipules large ovate acuminate with a single tooth at the base on each side
14982 Stem nearly erect simple or branched, Leaves ovate concave acutely emarginate, Stipules minute ovate bifid, Fruit terminal, Cal. oblong cylindrical little plaited
14983 Leaves rounded quadrate 3-4-fid, Stipules lanceolate acutely bifid: their margins lacerated
14984 Lvs, very concave nearly hemispherical emarg. Stip. ovate lanc. obtuse, Fruit term. upon short branches 14985 Leaves imbricated above subquadrate incurved acutely 4-toothed, Stip. broadly quad. 4-tooth. Fr. radical 14986 Lvs. imbricat. above ov, convex obtusely trident. Stip. broadly subquad. cren. Fr. from lower part of stem
** Leaves bifid: segments unequal folded together.
a Lower segments or smaller ones flat.
14987 Livs. unequal. lob. : upper lobes round. ov. nearly ent. ; lower and stip. ligulate quite entire, Fruit lateral 14988 Lvs. unequal 2-lobed spinul.-toothed: upper lobes roundish ov. ; lower ligul. Stip, obl. quad. spiny toothed 14989 Leaves very convex unequally 2-lobed: lobes and lobules ovate bipart. fringed with long and slender ciliz 14990 Stem procumbent bitripinnate, Leaves very convex unequally 2-lobed: upper lobes 2-parted spiny toothed; lower very minute oblong entire
14991 Leaves nearly fat unequally 2-lobed cut into numerous capillary segments: upper lobes 2-partite; lower minute, Stipules subquadrate laciniate
\(b\) Lower segments or smaller ones involute.
14992 Stem creeping unequally branched, Leaves unequally 2-lobed : upper lobes rounded; lower minute invol. Stipules large rounded obcordate

History, Use, Propagation, Culture,
2254. Marchantia. Named by Nicholas Marchant, in honor of his father John Marchant, the first botanist whom the Academy of Sciences of Paris admitted among its members, in 1666. Soft-leaved creeping plants, with green cellular fleshy fronds spreading over the surface of the ground in wet places. M. hemisphærica and polymorpha are often the pest of the florist, whose flower pots are overrun by them, and continually dis-
figured. Riccia. Pietro Francisco Ricci, was a Florentine botanist, who left some of his works to the academy of Florence. Little, generally floating, simple plants, of the nature of which very little is known. Only onc kind has been observed in fructification, and that is of a very ambiguous character. The thecæ, or the organs so called, are little round bodies immersed in a cavity of the frond, and containing minute sporules
2256. Anthoceros. From oxitos, a flower, and zEos.s, a horn, on account of the horn-like form of the theca, which old botamists considered to be the flower. Minute frondose plants, with a linear 2 -valved theca, containing a columella to which the sporules are attached. In habit they resemble Jungermannia.

14993 Lvs. unequal. 2-lobed: upper lobes rounded; lower minute invol. Stip. roundish acutely bifid, Fruit lateral
14994 Lvs. unequally 2 -lobed: upper lobes ovate-acum, mostly curved at extremity; lower ovate acutely bifid 14995 Stem creeping unequally branched, Leaves unequally 2 lobed: upper lobes hemispherical ; lower minute almost obsolete, Stipules ovate rounded bifid, Fruit lateral
14996 Stem creeping branched, Leaves unequally 2-lobed: upper lobes larger calyptriform; lower bluntly square circumvolute, Fruit lateral
c Lower segments or smaller ones saccate.
14997 Stem creeping branched, Leaves unequally 2-lobed: upper lobes ovate spiny-serrated: lower minute saccate generally 1-toothed at base, Fruit lateral
14998 Lvs, unequally 2lobed: upper lobes ovate rounded; lower rounded saccate, Stip. rounded flat emarginate 14999 Lvs, unequally 2-lobed: upper lobes ovate roundish; lower minute obov, saccate, Stip. subquadrate emarg.

15000 Frond obl. đecumb. nervl, feshy nearly plane above: swell, ben. ; irregularly branch. The margin sinuated 15001 Frond lin. nerveless fleshy compressed branched in a pinnated manner, Fruit marginal, Cai. very short
\[
\dagger \text { Nerved. }
\]

15002 Frond obl. submemb. dichot. costate having scattered scales on the underside, Cal. and calyptra within frond 15003 Frond obl. submembranous irregularly divided obsoletely ribbed : the margin entire or lobed and sinuated, Fruit from upper part of frond near the apex
15004 Frond lin. dichotomous membranous costate glabr. above : more or less hairy beneath and on the margin, Fruit from the lower surface of the nerve
15005 Frond lin. dichotomous membranous costate pubescent in every part
[of the fronds
15006 Frond obl. somew. branch. memb, costate : the margin nearly entire, Fruit arising from the superior surface
15007 Frond obl. dichotomous membranous costate with the margin entire, Fruit arising from the upper surface of the frond

15008 Recept, of thecæ deeply cut in a stellated manner into about ten narr, segm. : that of the anthers pedunculat. 15009 Recept. of thecæ hemispherical cloven into about 5 oval segments
15010 Recept. of thece entire conical ovate somewhat angular: that of the anthers sessile
15011 Recept. of thecæ hemispherical half 4 -cleft of 4 cells
15012 Frond small obl. somew. divid. : the segments 2-lobed at the end fleshy glaucous dotted on the surface 15013 Frond triangular cordate covered with long linear lanceolate segments on one side
15014. Frond membranous dichotomous, Lobes retuse

15015 Fronds membranous lobed peliucid, Theca beneath the sinuses of the lobes solit. exserted turbinate tootl..
15016 Fronds bipinnatifid linear
15017 Fronds multifid lobed sinuated, Theca subulate half bifid
15018 Fronds lobed rounded flat, Theca short

15019 Frond flat imbricated lobed, Lobes rounded retuse
15020 Frond simple ovate, Thecæ pyriform clustered at the base of frond

and Miscellaneous Particulars.
2257. Targionia. So called in remembrance of John Anthony Targioni, a meritorious Florentine botanist, who published in 1734 a work for the purpose of shewing the importance of botanical lectures, with reference to a course of studies in medicine. There was also another Florentine physician called John Targioni Tozzetti, after whom Tozzettia has been named. This genus consists of only one species, which is frondose and lobed. The theca is concealed and almost sessile within the involucre, globose, bursting at the apex, and discharging its sporules mixed with spiral filaments. This genus is very near Jungermannia.
2258. Sphcerocarpus. From \(\sigma \phi \alpha s \rho \alpha\), a globe, and \(x \propto \rho \pi 05\), fruit, in allusion to the form of the fruit. The plant consists of a roundish delicate membranous frond, bearing on its disk a cluster of obpyriform receptacles, each of which has a globose transparent finely membranous seed-vessel, filled with minute sporules unmixed with elastic flaments.

Order 7. ALGE.

Reproductive organs of two kinds. 1. Thecre or tubercles variously situated. 2. Sporules or granules naked or immersed in the frond. Plants always aquatic and submersed.
Turs order is constituted of the sea-weeds of our ocean, and of the floating scum-like substances of our ditches and rivers. Little is known of the functions which what are called their reproductive organs perform. The nature and structure of those organs are so various as to render it improbable that they should all be destined for the same purposes. The bodies which are called sporules are variously situated; now filling distinct thecze ( \(a\) ), or even tubercles \((b)\), which are either free \((b, c, d)\), or imbedded in the substance of the frond \((e, f)\); now appearing to be naked and surrounded by an involucre ( \(g\) ) ; now scattered or arranged in some determinate manner in the interior of the frond. ( \(h\) ) The fronds are either cylindrical ( \(h\) ), or plane ( \(i\) ), sometimes little more more than a mere membrane, sometimes hard and horny, and extended to the length of many feet. Many are articulated \((i, k)\) : their line of separation is then called a joint, and the space between two joints an articulation.

Professor Agardh, of Lund, one of the most celebrated of modern cryptogamists, and whose disposition of Algæ is adopted here, in his latest work, called Systema Algarum, published at Lund, in 1824, defines the order thus:
"Aquatic plants destitute of cotyledons and of sexual organs; gelatinous, membranous, or coriaceous; filamentous, laminose, or even leafy; in color green, purple, or olivaceous; jointed or continuous; bearing sporidia", (little transparent bodies containing sporules), "either included in pericarps or scattered over the surface"

The Algæ form one of the three forms of the lowest order of vegetation, Lichens and Fungi the two other. Of the former, many are considered by some botanists to be animalcula, and others, to be the young seedling plants of mosses.

\section*{Tribe I. DIATOMEX.}

Bodies of various forms, flat and crystalline, and separating into fragments,
2259. Achnanthes. Frond stalked, vexilliform. Marine.
2260. Diatoma. Filaments jointed, hyaline, rigid, simple, united in pairs longitudinally, at length separating into articulations cohering by their alternate angles.
2261. Fragillaria, Filaments jointed, simple, gelatinous, compressed, fragile, separating at the joints.
2262. Meloseira. Filaments jointed, contracted at the joints, very fragile, and easily separating.
2263. Desmidium. Filaments transversely and densely striated, mucous, flexible, green, half separated into articulations, and in that state pinnatifid.
2264. Schizonema. Filaments bead-like, composed of narrower cohering filaments inclosing elliptical granules, into which they are finally dissolved. Marine.

\section*{Tribe II. NOSTOCHIN庣}

Individuals numerous, globular or filiform, suspended in a gelatine of a definite form.
2265. Palmella. Minute or small, somewhat diaphanous gelatinous plants, filled with solitary granules unmixed with filaments.
2266. Echinella. A roundish gelatine crammed with elliptical radiant corpuscles. Marshy.
2267. Alcyonidium. A spongy fleshy lobed frond filled with granules. Marine.
2268. Nostoc. Plants roundish or shapeless, gelatinous. Substance composed of curved moniliform simple filaments, lying irregularly in a gelatinous nidus.
2269. Corynephora. A gelatinous roundish puckered frond filled with jointed filaments, bearing here and there clavate processes.
2270. Rivularia. A gelatinous subglobose frond filled with filaments, radiating from a common centre, continuous, placed on a globule, and marked with annulations inside.
2271. Chatophora. Plant elongated or globose gelatinous. Substance composed of branched articulated filaments.
2272. Scythymenia. A coriaceous tough stratum, formed of fibres and granules mingled together.

\section*{Tribe III. CONFERVOIDE压,}

Filaments jointed either externally or internally, separate, and not combined in any definite form.
2273. Byssocladium. Filaments like cobwebs, scattered externally with sporidia. Slightly inundated.
2274. Mycinema. Filaments membranous, opaque, tenacious, colored (usually tawny). Slightly inundated.
2275. Chroolepus. Filaments rigid, nearly solid, opaque, crumbling into powder, torulose. On roclos or bark.
2276. Trentepohlia. Filaments fexible, colored, bearing capsules, which generally proceed from the last articulation, which is inflated. Inundated or fluviatile.
2277. Scytonema. Plant not gelatinous, coriaceous. Flaments short, forming dark dense tufts, beaded internally, or filled with annular transverse bodies. On rocks or inundated, rarely marine.
2278. Stigonema. Filaments continuous, coriaceous, naked, marked inside with dots disposed in rings. On rocks.
2279. Protonema. Filaments somewhat jointed, rooting very minute.
2280. Hygrocrocis. Filaments hyaline, arachnoid, obsoletely articulated, floating in a shapeless gelatine or in a colored membrane.
2281. Leptomitus. Filaments hyaline or slightly colored, arachnoid, obsoletely articulated, separate, crect, not entangled.
2282. Mesogloia. Frond filiform, cylindrical, gelatinous, with compact somewhat moniliform branches radiating from a medullary pith, and bearing capsules.
2283. Batrachospermum. Frond filiform, gelatinous, sending out from the primary filament moniliform gemmiferous branches.

2284, Draparnaldia. Filaments green, jointed, very gelatinous, Ramuli penicillate fascicled. Fructification a granular mass in the articulations of the main filaments.
2285. Oscillatoria. Plants gelatinous. Filaments simple, continuous, membranaceous, filled internally with transverse parallel striæ.
2286. Calothrix. Filaments destitute of a mucous matrix, stiffish, straight, motionless, with a contiruous tube annulated inside.
2287. Lyngbya. Filaments without a mucous matrix, freely floating, flexible, motionless, with a continuous tube annulated inside.
2288. Bangia. Filaments capillary, mostly simple, tubular, continuous. Fructification; granules disposed in regular transverse series or strata.
2289. Zygnema. Filaments jointed, simple, gelatinous, compressed, fragile, separating at the joints
2290. Mougeotia. Filaments articulated, connected like a net, with irregularly placed granules, and thecæ attached to the angles of the meshes
2291. Hydrodictyon. Filaments articulated, connected like a net. Articulations viviparous, including young individuals.
2292. Conferva. Filaments uniform, jointed, membranaceous, simple or branched, mostly green. Fructitication, granules scattered in the articulations, Salt and fresh water.
2293. Bulbochcete. First flament articulated, sending out from the apex of the articulations an accessory branchlet. Thecæ alternating with the accessory branches. Marshy.
2294. Nitella. Filaments consisting of a single tube, membranous, jointed, with whorled branches. Organs of fructification twofold and separate; first nucules spirally striated, without bractes, and not crowned; second, colored globules. Sea and marshes.
2295. Chard. Filaments spirally striated, jointed, with whorled branches. Organs of fructification twofold, and close together; first, nucules spirally striated, furnished with bracteæ, and crowned; second, colored globules. Sea and marshes.
2296. Ceramium. Filaments jointed, subdichotomous, red, articulations veined or diaphanous. Fructificâtion; capsules with an involucre of short ramuli. Marine.
2297. Griffithsia. Filaments jointed, rose red, branched. Articulations marked with one broad tube-like line, the joints pellucid. Fructification; pedunculated capsules on the ramuli. Marine.
2298. Chatospora. Filaments obsoletely articulated, rosy, covered by axillary articulated fruit-bearing branches, which either include in the middle a globe of sporules, or change to a lanceolate receptacle covered with setæ, among which the sporules nestle. Marine.
2299. Polysiphonia. Filaments jointed, longitudinally striated, with internal parallel tubes. Fructification; double ovate capsules, and granules in swollen branchlets. Marine.
2300. Rytiphlaca. Frond flattened, distichous, transversely striated, becoming black when dry, with incurved ramenta, Fruit twofold; first, spherical capsules with pyriform sporidia; and second, lanceolate pods with roundish sporidia, Marine.
2301. Ectocarpus. Filaments jointed, much branched, fuscous. Fructification; lanceolate pods or ovate capsules solitary or racemose. Marine.
2302. Sphacellaria. Filaments jointed, branched, olivaceous, distichous or dichotomous; apex of the branches sphacellate or hyaline, abrupt. Fructification; granules in the sphacellated apex, or capsules. Marine.
2503. Cladostephus. Plant olivaceous. Main filaments opake, inarticulate; branches jointed, mostly whorled with ramuli. Fructification; capsules. Marine.

\section*{Tribe IV, UJfaces}

Frond membranous, continuous, tubular or flattened, never ribbed, herbaceous, or very rarely purple. Fruit a heap of sporules, either naked, or forming scattered granules covered by coniocystas.
2304. Vaucheria. Filaments dichotomous or irregularly branched, somewhat rigid. Fructification; a granulated mass within the frond, and external dark vesicles variously sinuated.
2305. Codium. Frond spongy, of a determinate figure formed of filaments densely packed, which are tubular and continuous, and colored by a granular green powder. Coniocystas clustered at the surface of the frond.
2306. Bryopsis. Root minutely scutate. Filaments tubular, continuous, aggregated, branched, pinnate, or imbricated upwards with branchlets. Fructification a dark internal granular mass.
2307. Solenia. Frond tubular, membranous, with a striated areolated surface. Sporidia very minute and compact.
2308. Ulva. Root scutate. Frond plane, ribless, flabelliform or wedge-shaped, or linear and dichotomous. Fructification naked immersed; granules distributed in fours throughout the frond.
2309. Porphyra. Frond flat, purple, with the membrane of equal texture. Fruit twofold; first, sori of oval sporidia collected in a disorderly manner; second, two parallel lines marked on each side by a globule.

\section*{Tribe V. FLORIDEA.}

Frond coriaccous or rarcly membranous, flat or filiform, continuous, purple or pink. Sporidia purple, included in capsules or clustered in sori.
2310. Polyides. Frond filiform, fastigiate, cartilaginous, softish, composed of radiating fibres. Fruit, spongy warts composed of fibres supporting sporidia-
2311. Ptilota, Root scutate. Fronds compressed or plane, pinnate. Fructification; a cluster of naked granules surrounded by a linear cleft involucre.
2312. Rhodomela. Frond either flat or foliaceous, and somewhat ribbed or filiform. Fr uit twofold; first, lomenta filled longitudinally with globules of sporaceous matter; second, capsules with a few pyriform sporidia sessile in the capsule (blackish when dry).
2313. Chondria. Frond continous, gelatinoso-cartilaginous. Fructification double; naked granules immersed in the substance of the ramuli and external tubercles.
2314. Sphcerococcus. Root scutate. Frond submembranaceous or cartilaginous. Fructification uniform; tubercles or capsules.
2315. Halymenia. Frond flat or tubular, somewhat membranous. Fruit, dot-like tubercles half immersed in the lamina of the frond.
2316. Bonnemaisonia. Frond filiform, compressed, pectinate, ciliated. Fruit, capsules with pyriform sporidia fastened together in a chain-like manner.
2317. Delesseria. Root scutate. Frond plane, membranaceous, with or without ribs. Fructification double, tubercles and clusters of naked immersed granules.

\section*{Tribe VI, FUCOIDE业。}

F'rond coriaceous, rarely membranous, continuous, olive-green, flat or filiform. Sporidia black, includea in capsules, which are either ovate, and surrounded by a hyaline border, and ncstling in a peculiar receptacle, or pyriform, and immersed in the frond.
2318. Lemanea. Frond filiform, torulose, tubular. Chains of sporæ adhering to the inner surface of the filament, pencilled moniliform. In fresh water.
2319. Chordaria. Root scutate. Frond filiform of an olive color and cartilaginous substance. Fructification; clavate, pyriform, concentric filaments constituting the whole frond.
2320. Scytosiphon. Root scutate. Frond tiiform, tubular, subcoriaceous. Fructification; naked pyriform granules covering the whole frond.
2321. Sporochnus. Root mostly scutate. Frond plane, with distichous branches, bearing, in most instances, delicate pencil-like deciduous tufts of confervoid filaments. (" Receptacles composed of concentric, clavate, articulated corpuscules.'")
2322. Haliseris. Frond flat, linear, ribbed, membranous. Capsules heaped in sori.
2323. Encalium. Frond tubular or bladdery, dotted. Fruit, the tips of the frond filled with a black sporuceous matter.
2324. Zonaric. Root downy. Frond plane, ribless, flabelliform or wedge-shaped, or linear and dichotomous. Fructification, adnate tubercles collected into parallel lines on the frond.

NOSTOCHINAE.

History, Use, Propagation, Culture,
2229. Achnanthes. From \(\alpha x \%\), the froth of the ocean, and ar. 905 , a flower. Marine productions, separating into fragments, but by degrees. In the middle of each articulation are one or two crystalline points.
2230. Díatoma. From sioroum, incision, in allusion to the curious manner in which the filaments are divided into joints cohering alternately by their angles.
2231. Fragillaria. So named on account of their fragile nature, which is more remarkable than that of other Confervæ. The filaments when complete are flat and composed of little fragments glued together crosswise. These are very narrow, and when once separated do not cohere again.
2232. Meloseira. From \(\mu \in \lambda o 5\), a membrane, and \(\sigma \varepsilon \Leftarrow \mu\), a chain, with reference to the form of the filaments. This genus differs from the last, as Conferva from Oscillatoria.
2263. Desmidium. From \(\delta \varepsilon \sigma \mu \Delta s\), a bond, in allusion to the singular manner in which the parts cohere when in a state of dissolution. At that period the articulations become half separated one from the other in such a way as to represent a pinnatifid appearance.
2264. Schixonema. From \(\sigma \chi \leqslant \omega\), to divide, and \(y n \mu \alpha\), a filament; the filaments are finally divided into compound granules. These plants have entirely the habit and flexible substance of Conferva. When fresh they are sparkling and brown, when dry olive-green, and very shining. They are composed of many fliform individuals, which include nearly the same corpuscles as are visille in the foreign genera Frustulia and Meridion.
2325. Laminaria. Root fibrous. Stipes dilated into a plane frond. Fructification, naked granules immersed and forming irregular groups in the frond.
2326. Lichina. Fronds minute, tufted, greenish-black when growing. Fructification solitary fubercles with a pore, at length scutelliform.
2327. Furcellaria. Frond cylindrical. Fructification concealed in the swollen extremities of the frond, capsules in the centre, and pyriforme granules in the circumference.
2228. Fucus. Root scutate. Frond plane or compressed, (rarely filiform) dichotomous. Fructification, tubercles contained in a common mucose receptacle, and filled with sporules and filaments.
2;329. Cystoseira. Root scutate. Stipes cylindrical. Lower leaves plane, upper ones filiform, furnished with pinnate vescicles. Fructification, tubercles in common receptacles, the receptacles with several loculaments.

\section*{DIATOMERE.}

15021 Articulations with one dot, Stem long
15022 Filaments striated, Articulations nearly equal in diameter with parallel striæ
15023 Articulations half as long again as wide granular transversely
15024 Filaments greenish, Articulations square striated
15025 Filaments arcuate transversely striated, Articulations nearly square with pellucid joints
15026 Articulations half as long again as wide oblique marked with a pellucid transverse band and a dot
15027 Filaments tapering very rigid with parallel transverse dense striæ
15028 Filaments tapering orange-colored, Articulations twice as short as their diameter
15029 Filaments unequal containing nearly circular moniliform globules in rows
15030 Joints contract. Articulations transversely striat. with 1 or 2 very fine lines about 3 times as long as wide
15031 Articulations shorter than broad finally changed into somewhat oval close moniliform heaps
15032 Filaments after copulation pinnatifid traversed by a longitudinal green streak, Articulations 2toothed
15033 Filaments somewhat branched cæspitose acute, Granules parallel clustered
15034 Filam. somew. branched cespitose acute, Granules clustered appressed, Membrane of filam. inconspicuous
15035 Filaments densely branched virgate, Granules elliptical
15036 Filaments minute continuous erect branched containing cylindrical oblong scattered granules
15037 Filaments slender erect dichotomous, Branches swollen here and there into roundish knobs: interior gelatinous with numerous cylindrical oblong granules

\section*{NOSTOCHINAE.}

15038 Frond thick angular-lobed, Granules elliptical
15039 Fronds aggregate minute globose, Granules globose
15040 Frond deformed rugose, Granules globose brown

2265. Palmella. Apparently a diminutive of Palma, a little palm; but the application of the name is not obvious in that sense. The plants are found in marshy or inundated places, and consist of globules nestling in a gelatine; in which respect the genus differs from Protococcus, the Red Snow plant. It is supposed that many of the species are only the ova of animalcules.
The Red Snow plant, which, as we have just said, is nearly related to this genus, has not hitherto been noticed in this country, but as it has been found in many countries similar to our own regions of snow, it is so probable that it exists in Great Britain, that we insert some particulars of it here, especially as it may be considered to have been introduced at least in 1819, by Captain Ross's expedition to the North Pole. When viewed under the highest powers of a simple microscope, it appears to consist of globules containing a red fluid. We select the following observations upon its history, from a communication made to the News of Literature and Science, on the twenty-first of January, 1826.
"Our scientific readers will remember the interest which was excited on the subject of this natural production, upon the return of Captain Ross from his Polar expedition, some years since. At that time it was examined by three of the most acute observers in this country, especially of microscopical objects, Wollaston, Brown, and Bauer, who all formed a similar conclusion in one respect, that it was of vegetable origin, but were of different opinions as to its precise nature: Dr. Wollaston supposing it to be the seed of a moss ; Mr. Brown, a substance belonging to Algæ, and nearly related to Tremella cruenta, a common British plant; and Mr.

History, Use, Propagation, Culture,
Bauer refering it to a genus of Fungi, called Uredo. We have lately seen a curious paper upon this subject, by Professor Agardh, of Lund, whose opinions upon all matters connected with the lower orders of vegetation demand deep attention.
"That snow occasionally assumed a red color, had long been a fact of which there could be no doubt; and that water was also under particular circumstances stained with red, we have the popular traditions of showers of blood, and water changed to blood, to attest. In the year 1608, a shower of blood fell near Aix, in France, which was examined by Peiresc, and found to be caused by insects; and to the same cause was undoubtedly to be ascribed the bloody rain that fell at Schonen, in 1711, which the learned Bishop Swedberg looked upon as a supernatural phenomenon, and a direct sign of the anger of the Divinity. The red pools which are occasionally met with, even in this country, are generally stained by the presence of an immense number of animalcules, called Daphinia Pulex, or Cyclope quadricornis. The red stains sometimes seen upon the seashore are occasioned by a particular sort of Fucus. Professor Agardh proceeds to observe, that the red snow is very common in all the alpine districts of Europe; where it is probably, for the most part, of the same nature as that brought from the North Pole by Captain Ross. Saussure saw it in abundance upon Mount Brevern, in Switzerland, and elsewhere; Ramond found it on the Pyrenees, and Sommerfeldt in Norway. In March, 1808, the whole country about Cadore, Belluno, and Feltri, was in a single night covered to the depth of twenty centimetres with a rose-colored snow; at the same time a similar shower was witnessed on the mountains of Valtelin, Brescia, Carinthia, and Tyrol. But the most remarkable red-snow shower was that which fell on the night between the 14th and 15 th of March, 1823, in Calabria Abruzzo, in Tuscany, and at Bologna, and upon the whole chain of the Appennines. We may add, that both snow and ice were seen stained with red, green, and blue, by the late expedition under Baron Wrangel to the Frozen Ocean.
"With this information before him, Professor Agardh proceeds to consider the nature of this remarkable substance, which he concludes, with Brown, to be referable to the lowest order of Alge, and to stand as a distinct genus, which he calls Protococcus, upon the very limits of the animal and vegetable kingdoms. Saussure, indeed, from finding that the red snow of the Alps gave out, when burnt, a smell like that of plants, concluded that it was of vegetable origin; but he supposed it to consist of the farina of some plant, although he could neither account for its having ascended to such elevated regions, nor mention a plant whose farina was of that color.
" Besides the plant called Palmella cruenta, which is similar in its structure to the red-snow plant, other low vegetable productions have been noticed by different authors, as possessing a similar color. Such are the Lepraria Kermesina, which, by the way, is considered only a particular state of the red-snow plant itself, and the Byssus cobaltiginea. These are always found in situations in which they are exposed to the intense action of light, such as vast plains of snow, or masses of glittering limestone. Whence it is inferred, that the color of the red snow is attributable to the action of light, modified in some mysterious manner, by the nature of the body on which it strikes. In confirmation of which hypothesis, it is remarked, that when the Lepraria

15041 Minute roundish soft rose-colored containing extremely minute sporules
15042 Frond deformed rugose, Granules ovate red
15043 Frond crust-like crimson
15044 Corpuscles radiant lanceolate jointed

15045 Branches elongated
15046 Branches short obtuse
15047 Frond filiform simple

15048 Frond expanded deformed plaited wavy
15049 Frond globose watery inside, Integument coriaceous very smooth
15050 Frond globose solid smooth
15051 Frond bladdery subcoriaceous hollow plaited smooth

15052 The only species

15053 Frond hemispherical hard, Filaments very dense branched by apposition 15054 Frond globose hollow, Filaments simple
15055 Filaments intermingled with calcareous particles hard and crustaceous when dry

15056 Frond tubercular hollow, Filaments distributed in many little orbs
15057 Frond linear flattish dichotomous at base much pinnated at end
\(\beta\) Branches very short
15058 The only species

and Miscellaneous Particulars.
Kermesina is found under stems, stones, or in crevices of limestone, where light can scarcely gain admittance, its color gradually passes from red to green.
"The only difficulty in the way of this explanation of its nature is in the statements of so many observers, that the red snow falls from the air. But Professor Agardh shrewdly remarks, that all the persons agree that it fell in the night, which is as much as to say, that no one saw it fall. He is of opinion that the Protococcus, or Red Snow, is called into existence by the vivifying power of the sun's light, after its warmth has caused the snow to dissolve, and accompanied by that incomprehensible power in white snow, of producing a color; and, moreover, that it first attracts the eye when there is a considerable quantity, in the same way that we do not see the color of drops of water till they have accumulated in the ocean."
2266. Echinella. From echinus, an hedgehog, in allusion to the bristly appearance presented by its radiant particles. Many naturalists believe the bodies referred to this genus to be animalcula.
2267. Alcyonidium. So called, from \(\alpha \lambda \varkappa\) voy genus are naturally produced. This also is supposed to be the nidus of animalcula. Lamouroux who originally fixed it here, afterwards referred it to Zoophytes; in which last opinion Gaillon agrees with him, declaring that he has actually seen the animalcula nestling in it. D'Orbigny and Ellis consider it the ova of a testaceous animal.
2268. Nostoc. A name first used by Paracelsus, without an explanation of its meaning. Agardh thinks this singular substance changes into the genus Collema among the Lichens,
2269. Corynephora. From zogun \(n\), a club, and \(\phi \in \rho \omega\), to bear, in allusion to the clavate filaments which are found on different parts of it. The species are found in the ocean."
2270. Rivularia. So named on account of the places in which the species grow. They have a globose frond, of a gelatinous but toughish texture. Their color is dark-green, and not as in the next genus, pale-green. The filaments are very singular, seated on a globule, simple, cylindrical, and terminated by a very fine point; they are densely compact, continuous, and filled with a green annular matter.
2271. Chactophora. From \(\chi^{\alpha s \tau \gamma,}\), a bristle, and \(\phi \in \rho a\), to bear; the filaments are terminated by a bristle-like point. This genus is chiefly distinguished from Confervoidez by its gelatine. The color is bright green, and the texture softer than in the preceding. The manner of propagation, which has been noticed in so small a number of Algæ, has been observed by Agardh in two species of this genus. In Chætophora pisiformis little hard crystalline corpuscles, like grains of sand, may be seen, which separate from the mother plant and produce young filaments. But in C. clavata, the points of the filaments fall off and sink to the bottom of the water, where they unite by three, four, five, or by a greater number at a time, in a common point, which is first green, afterwards blackish, and apparently inorganic. From this beginning new individuals arise.
2272. Scythymenia. Derivation unknown. A very singular plant, formerly referred to Ulva. It has the habit of a fungus, and grows upon damp walls. It is supposed to be most nearly related to Palmella,

History, Use, Propagation, Culture,
2273. Byssocladium. From byssus, a kind of fungus, and \(\approx \lambda \omega \delta 05\), a branch; the filamentous branches of this plant being very similar to those of Byssus. These plants grow, in places occasionally overflowed with water. 2274. Mycinema. From \(\mu v \approx \eta s\), a kind of minute fungus, and עnux, a thread; in allusion to the resemblance of the filaments to those of some Fungi.
2275. Chroolepus. So called on account of the change which is undergone by the exterior membrane which changes to powder; from \(\chi\) woos, skin, and \(\lambda \varepsilon \pi \omega\), to decorticate.
2276. Trentepohlia. So named, in honor of an obscure German botanist. This is an ill-defined genus, which is much in need of reformation.
2277. Scytonema. From \(\sigma \neq \tau 05\), leather, and vnu๙, a filament; in allusion to the coriaceous nature of the filamentous frond. The species grow chiefly on stones ir inundated places, and are rarely found in salt water.

\section*{CONFERVOIDEAE.}

and Miscellaneous Particulars.
2278. Stigonema. So named in allusion to the regular annular dots of the filaments; from slyay, dotted, and vnuce, a thread. This genus is similar in habit to the Lichens. The color is opaque and brown; the filaments are branched with spines, and marked internally with distinct dots.
2279. Protonema. It is uncertain whether this genus is not rather the young state of germinating mosses; it is named in allusion to the simplicity of its structure, from \(\pi \rho o r o s\), first, or primary, and ynuce, a thread.
2280. Hygrocrocis. From úgos, any thing belonging to water, and \(\approx\) gozs, a little tuft. These plants are round in chemical solutions of vegetable matter, as in ink, \&c.
2281. Leptomitus. Substances foating in the water, and produced by animal matter in a state of decay. They consist of exceedingly fine intertangled fiaments, whence the name, \(\lambda \varepsilon \kappa \tau 05\), slender, and \(\mu \mathrm{ito} \mathrm{\varsigma}\), a thread.

and Miscellaneous Particulars.
causes, as from the elasticity of the filaments, from the motion of minute animalcula. Agardh, however, declares that 0 . curviceps has naturally the motion of an animal, but of a creeping not oscillatory nature.
2286. Calothrix. From zaдos, beautiful, and \(9 \rho \cdot \xi\), hair, in allusion to the beauty of the entangled filaments; the latter appear as if branched, by the singular juxta-position of small filaments.
2287. Lynglya. H. C. Lyngbye, a Danish botanist, is the author of an excellent work on Algæ, which he calls Hydrophytologiæ Danicæ Tentamen, published at Copenhagen, in 1819, in one volume quarto. This genus differs from Oscillatoria in the absence of a mucous matrix, and from Calothrix in being curved and quite distinct. In habit it approaches Conferva.
9288. Bangia. So called in honor of Christian Frederick Bang, the author of a disserfation upon the plants of sacred history, published in 1767.

15171 Brównii Dillw. \(-\frac{1}{2} \frac{1}{2}\) spring \(G \quad\) Irishcaverns Dillw. conf. t. D.

History, Use, Propagation, Culture,
2289. Zygnema. From juvos, a yoke, and mux, a filament; in reference to the singular manner in which the filaments are jointed together in pairs.
2290. Mougeotia. Named in honor of J. B. Mougeot, the coadjutor of Nestler, in the publication of their useful work, the Stirpes Cryptogamæ Vogeso-Rhenanæ, which, we believe, is still continued.

\section*{* Two dotted.}

History, Use, Propagation, Culture,
held to be efficacious in healing fractured limbs. Pliny declares, he was witness to a cure of this kind. Some of the species of this genus are believed to be merely the young of mosses.
2293. Bulbochoete. From \(\beta o \lambda \beta o s\), a club, and \(\chi \alpha i \tau \eta\), a bristle, in reference to the bristly end of the primary filaments.
2294. Nitellic. From niteo, to shine. A genus separated by Agardh from Chara, because the stem is composed of a simple tube, and not of one spirally striated. The plants have the habit of Chara.
2295. Chara. The origin of this word is unknown. It first occurs in Cæsar's Commentaries, where it is mentioned as the name of a plant, the root of which was used by the Roman soldiers as food. That plant could have had no relation to the plant of the moderns. Various opinions have been held with regard to the station of this genus. Linnæus referred it to the perfect plants, and he has been followed by many botanists, Dr. Hooker and Mr. Lindley, in the former's Flora Scotica, formed it into a particular order, placed between Algæ and Hepaticæ; and with this opinion Dr. Greville coincides. But Professor Agardh thinks it cannot even be separated from true Alga, in the midst of which he has placed it. The nature of the fructification is so paradoxical, that it is scarcely possible to trace an analogy between it and the fructification of any other plant.

15172 Filam. branched very minute equal parallelly exserted from an orbicular base
15173 Filam. branched remotely capillary very long, Branches short divaricating, Artic. twice as long as broad 15174 Filam. branched capillary, Branches alternate: those at the end clustered one-sided erect, Artic. cylind, about twice as long as broad
15175 Filam. branch. Branches altern. rem. Artic. cylind. 6-10 times as long as broad alternately compr. when dry 15176 Filam. branch. capill. Branch, divaricat. 1-sid, : upp. numer. somew. recurv. 15186 Filam. from a common centre forming a globe rigid branched obtuse, Artic. 5 times as long as broad
15187 Filam, branch., straight virg. capil. Branch. erect somew. hyal. and thicken. at end, Artic. of various lengths 15188 Filam, branched straight virgate capillary mucous, Branches erect when dry black at the ends
15189 Filam. more than bristly trichotom. shin. when dry dott. with black at joints, Artic. 3 times as long as broad
15190 Filam. much branch. Hexuose somew. cartilaginous fragile, Branches and branchl. scatter. Artic. torulose 15191 Filam. much branched straight rigid, Branches generally in threes obtuse, Articul. very long
15192 Filam. setac. dichotom. flexuose, Branch. rem. Branchl. short blunt, Artic. cylind. 4 times as long as broad

\section*{15193 The only species}

15194 Stem long, Branchlets blunt, Nucules nearly naked in heaps at the joints of the stem
15195 Stem trichotomous pellucid, Branchlets forked, Nucules axillary solitary
15196 Stem 2 -3-chotomous opaque, Branchlets forked or with broken joints, Globules solitary
15197 Fruit branches filiform with other long jointed ones between, Nucules clustered axillary
15198 Stem slender long, Branches acute forked, Fruit solitary
15199 Stem twisted furrowed strigose, Strigæ reflexed, Bractes aculeate
15200 Stem twisted ash-colored, Branches not jointed, Bractes linear twin thrice as long as nucule
1. Filaments short, fastigiate.

15201 Filam, somew. branch. minute ferrug. Branch. scatter. blunt, Artic. pelluc. in mid. 3 times as long as broad 15202 Filam. branched fine tufted, Branches scattered simple remote, Articul. 3 times as long as broad
15203 Filam. creeping rooting densely entangl. much branch. Joints somew. contract. Artic. narrowest in middle
15204 Filam, creeping minute branched, Branches erect naked at base pinnat. upw. Artic. twice as long as broad 15205 Filam. much branch. fastig. short, Branc. erect acute, Artic. thrice as long as broad, Caps. lateral clustered 15206 Filam. short cæspitose pulvinate, Branches and branchlets fastigiate erect, Artic. twice as long as broad
2. Filaments dichotomous, Branchlets forked, Joints obscure, Thece involucred.

15207 Filam. dichotom. much branched somewhat membranous variegated with purple and hyal. Joints elevated \(\beta\) Joints hairy
15208 Filam. dichotom, much branched somewhat cartilaginous, Branchlets forked, Artic. ovate opaque
3. Branches furnished with branchlets, which are more or less dense and shortened.

15209 Filam. branched virgate, Primary articulations twice as long as broad
15210 Filam. setaceous dichotomous, Artic. thickened upwards about 5 times as long as broad
15211 Filam. much branch. : prim. thick and contiguous, Altern. pinnules with artic, half as long again as broad 15212 Filam. much branched: primary without joints, Artic. as long as broad

> and Miscellaneous Particulars.

Greville observes, "This is a most curious tribe of plants, whose structure, I am convinced, is by no means well understood. At present, I have only minutely examined the fruit of C. vulgaris. Under a high power of the microscope, the globule is found to consist of seven triangular scales, which in maturity separate from each other, and produce the dehiscence of the globule. Each of these scales has a vacant portion in its centre, but the margin, which has a fluted appearance under a small magnifier, consists of a number of parallel, linearoblong, hyaline, hollow tubes, placed at small intervals from each other, those forming the angles of the scale being branohed. Within these tubes are a profusion of orange, globular, minute bodies exactly similar to the sporules of many cryptogamic plants), arranged in no order, and escaping on the least injury to the tubes. It is these little bodies which give the orange color to the globule. Within the globule is a mass of elastic white filaments, much convoluted, and distinctly either jointed or transversely rugose."

The calcareous matter of the stem and branches is not an adventitious incrustation, but is the result of some peculiar economy in the plant itself, as it evidently originates from within, and is covered with the cuticle. It is supposed to be analogous to the siliceous deposit beneath the cuticle of Equisetum.
2296. Ceramium. So called from zєœццоs, a little measure, in reference to the appearance of the capsules. All the species are found in the sea, and among the substances cast up upon the shore.

\section*{15227 The only species}
a. Purple or scarlet, fint, somewhat pinnated.

15228 Filaments bipinnate veiny rigid, Pinnæ and pinnules alternate, Articulations rather shorter than long 15229 Dark-red, Branches divaricate rigid, Articulations 3-tubed as long as broad, Stem rough with tubercles 15230 Filam. very much branch. Primary not jointed, Branches decomp,-pinn. Pinnules heterogen, multif, fascic.
b. Creeping, Branches divaricating, often one-sided.

15231 Filaments entangled with scattered branches, Branches divaricating, Articulations twice as long as broad c. Puple, whole-colored, adhering to paper.

15232 Filaments nearly equal branched virgate, Branches erect, Lower articulations 5 times as long as broad d. Pencilled, black above, generally rose-colored above, adhering to paper:

15233 Filam. much branched diffuse, Branches virgate spread. Lower artic, obsol. Artic. much longer than broad
15234 Filaments much branched at end diffuse, Lower articulations very short when dry nodulose: upper about as long as broad with 3 veins
B Filaments short somewhat pectinated, Branches nearly simple
15235 Filaments much branched diffuse, Branchlets spreading short, Articulations half as long again as broad
15236 Filam, dichotom, pencilled much branched, Articulations shorter than long netted veiny : lower obsolete
15237 Filam, much branched diffuse, Lower artic. 5-veined 4 times as long as broad: upp. 3-veined twice as long
15238 First filament not jointed spirally veiny, Articulations as long as broad, Capsules axillary
15939 Filaments branched veiny, Branches long, Artic. of stem long, of the branches thrice as short
e. Black or blackish-brown when dry, rigid, scarcely adhering to paper.

15340 Filam. dichotomous nearly equal fastigiate, Artic, shorter than broad with a black point in the middle
15241 Filaments dichotomous irregularly branched at end, Branches and branchlets very straight : upper artic. 3 times as long as broad
15242 Filam. much branched long diff. Branchl. short spread squarr. recurved, Lower artic. long: upper short f. Branchlets lateral, short, fascicled.

15243 Filaments decompound pinnated, Branchlets very short and fine, Articulations 3 times as long as broad 15244 Filaments branched virgate, Branch, alternately pinnated, Branchlets short multifid, Theca sessile ovate 15245 Filam, much branched covered with heterogeneous hair-like simple branchlets, Artic. very short obsolete

15246 Frond somewhat cartilaginous compressed transversely rugose bipinnated, Pinnules in fruit incurved
15247 Filam. nearly separate, Branches erect subulate, Artic. rather longer than broad, Pods linear subulate

15248 Filam. much branched very fine, Branches and branchlets opposite spreading attenuated acute, Artic half as long again as broad
15249 Filam. much branch. Branches scatt. spread, taper. ac.: at tips hyal. Artic. as long as broad finally tumid 15250 Frond rope-like somew. spongy divid. into branches, Filam. densely entang. A rtic. 4 times as long as broad

and Miscellaneous Particulars.

\footnotetext{
Hutchinsias, not being aware that the name of Miss Hutchins had previously been applied to a genus of Cruciferæ, by Mr. Brown. The species of this genus are, prerhaps, the most beautiful of all the tribes of Conferva. 2300. Rytiphlcea. So called, it is presumed, from \(\rho_{\nu \tau t 5, ~ a ~ w r i n k l e, ~ a n d ~}^{\phi \lambda \varepsilon \omega}\), to be filled with any thing. The filaments are essentially characterized by their numerous transverse rugosities.
2301. Ectocarpus. From \(\varepsilon \approx \pi n 5\), outside, and \(x \propto \% \pi 05\), fruit, because the thecæ are not included in the substance of the frond, as in the next genus, but placed on the outside. Marinc plants.

2316. BONNEMAISO'NIA. Ag. Bonnemaisonta.

History, Use, Propagation, Culture,
2312. Rhodomela. From podos, red, and \(\mu \varepsilon \lambda \Delta s\), a limb; in allusion to the color of the fronds.
2313. Chondria. The fronds of this genus are particularly cartilaginous, on which account its name has been formed from xov \(\delta\) gos, cartilage. C. pinnatifida is eaten in Scotland; it has a pungent flavor.
2314. Spherococcus. From r甲cuga, an orb, and zozぇos, fruit. The thecæ of the genus are round, and con-
tain a globose nucleus full of round sporidia.

15279 Frond flat obsoletely ribb. alternately bipinnatifid, Pinna linear cuneate, Pinnules cut, Thecæ urceolate 15280 Stem filiform covered with setaceous densely imbricated ramenta
15281 Frond filiform much branched, Branchlets setaceous subulate pinnate fascicled
15282 Frond filiform attennuate flexuose branched, Branches bipinnate: upper involute
15283 Frond filiform equal, Ramenta simple about one-sided clustered involute
15284 Frond compres. filif, somew. contract. here and there, Fructif. either min. tuberc. or scatter. spor, in ramuli 15285 Frond compressed 2-3-pinnate, Pinnæ alternate, Pinnules obtuse callous
15286 Frond round filiform many-times pinnated, Pinnæ opposite cylindrical clavate short horizontal
15287 Stem roundish filiform dichotomous, Ramenta elliptical scattered much attenuated at base
15288 Stem round filiform much branched, Ramenta clavate much attenuated at base
15289 Stem round filiform irregularly branched, Ramenta setaceous much tapered at base
15290 Stem filiform much pinnated, Ramenta linear-lanceolate distichous tapering at base
15291 Frond filiform contracted in joints tubular, Branches whorled
15292 Frond filiform chain-like in joints tubular, Branches fastigiate dichotomous and whorled

15293 Stem scarcely any, Laminæ chained obsoletely ribbed cuneate 2-forked or lariceolate, Thecæ rugose sessile in the disk of the frond
15294 Stem filiform somewhat dichotomous, Branches terminating in oblong 2-forked somewhat proliferous laminx, Thecæ spherical subulate terminal
15295 Stem filiform dichotom. Branches expanded in cuneiform multifid laminæ, Thecæ stalked ovate cauline 15296 Stem filif. nearly simple expanded into a cuneif. palm. laminæ: segm. ligulate, Thecæ hemisph. sess. in disk 15297 Frond flat dichotomous, Segments linear-cuneiform, Thecæ hemispherical sess. on the disk of the frond 15298 Frond somew. channel. dichotom. Segm. lin. cuneif. Thecæ spheric. scatter. on short stalks on disk of frond 15299 Frond membran. leathery flat somew, lanc, somew, branched ciliat. Ciliæ subulate bearing thecæ at end

15300 Frond cartilagin. compressed lin. somew. dichotom. Segm. ciliated, Ciliæ bear. thecæ either at sides or ends 15301 Frond cartilagin, corneous distich. branched, Segm. compressed flat linear bipinn. Pinnæ opp. spread. obt.

15302 Frond cartilagin. filif. compress, decomp. pinnated, Pinnæ horizontal altern. Pinnules bearing thecæ at end
15308 Frond cartilaginous much branched dichotomous pinnated, Segments tapered at base: lower compresed 2-edged; the last furcate acute
15304 Frond cartilaginous membranaceous dichotomous or palmate, Segments obtuse somewhat proliferous, Theca immersed in minute unequal processes
15305 Frond membranous dichotomous, Theca spherical marginal sessile
15306 Frond membranous dichotomous, Segm. linear ; upper palmate crested entire, Theca margin. immersed 15307 Frond cartilagin. round filif. Branch. long simp. surround. by little branch. Theca hemispher. sess, scatter. 15308 Frond filif. corneous rigid equal with entang, branches, Branches horizontal 1 -sided cluster. forked at end 15309 Fronds filif. much branch. BranchL, setaceous tapered at each end setac. Theca speric. attach. to branchI.

15310 Stem filiform dilated into a cartilaginous reniform or orbicular entire frond
15311 Frond fleshy flat simple cuneiform tapered at base into the footstalk rounded at end
15312 Frond coriaceous flat palmate entire, Segments cuneate oblong nearly simple

15313 Frond membranous tubular flat dichotomous, Axillæ rounded, Segments linear narrow by degrees sending out from the margin many simple ramenta
15314 Frond gelatinous coriaceous dichotomous, Segments filiform : end membranous dilated elliptical lanceol. 15315 Frond fliform with contracted articulations
15316 Frond subgelatinous filiform, Branches remote long, Sporules naked in the substance of the branches

15317 Frond filiform compressed much branched, Branchlets setaceous distichous simple pectinate on each side

and Miscellaneous Particulars.
2315. Halymenia. From \& \(\lambda_{5}\), the sea, and iumy, a membrane. Marine plants with flat or tubular membranous fronds. H, edulis is the true Dulse, and H. palmata the common Dulse, both of which are eaten in Scotland.
2316. Bonnemaisonia. So called in honor of M. Bonnemaison, a French cryptogamic botanist, who particu-
larly attended to Conferva,
2317. DELESSE RIA. Ag. Delesserta.

15318 Stem distinct, Leaves ovate stalked entire costate, Nerves transverse parallel
15319 Stem winged, Leaves linear oblong subsessile proliferous from the costa, Veins diaphanous nearly parallel
15520 Stem winged, Leaves linear-lanceolate costate veinless proliferous from the mibrib netted
15321 Frond ribbed obsoletely nerved linear dichotomous alternately pinnatifid towards end, Pinnæ rather lingui.

15322 Frond pinnated dichotomous much branched, Last branches falcate inwards and pectinate
15323 Frond very fine linear irregularly split entire at end, Segments rounded at end not veined, Sori marginal
15324 Frond very thin veinless roundish irregularly split at the end, Sori on the disk of the frond

\section*{FUCOIDER}

15325 Filaments simple papillose, Papillæ usually ternate, Articulations 5 times as long as broad \(\beta\) Branched torulose in a moniliform manner here and there
15326 Filaments simple moniliform incurved 1-colored

15327 Frond much branched, Branchlets virgate somewhat distichous spreading at base

15328 Frond quite simple

15329 Frond setaceous branched in an irregular manner

15330 Recept. elliptical lateral as long as peduncle
15331 Branches spiny alternate
15332 Frond many times pinnated, Pinnæ opposite capillary
15333 Frond many times pinnated nodose, Pinnz opposite, Nodi villous
15334. Frond irregularly branched, torulose and rugose in every direction

15335 Frond flat membranous scarcely nerved bipinnate, Pinnæ and pinnules opp. lin.-lanc. tapering at base
15336 Frond linear dichotomous entire, Sori heaped about the costa
1533i Frond inflated clavate

15338 Fronds reniform flabelliform smooth membranous, Zones concentric
15339 Dichotomous entire, Segments erect linear rounded blunt, Thecæ scattered on the disk
15340 Frond dichotomous entire, Segments long slender acute

15341 Stalk running through the lamina wnich is riddled with holes
15342 Stalk winged with pinnæ and running through the ensiform lamina
15343 Stalk round expanded into a roundish digitate split entire lamina
15344 Root inflated-bulbous, Stalk flat expanded into a digitate split entire lamina
15345 Stalk compressed expanded into an entire linear-oblong laminæ
15346 Stalk compressed expanded into a thin linear-lanceolate entire lamina

and Miscellaneous Particulars.
2321. Sporochnus. The meaning of this word is not explained. The genus is remarkable for the nature of the reproductive organs, which consist of a minute receptacle formed by some clavate corpuscles, which are jointed and arranged in a concentrical manner, and crowned with tufts of hair.
2322. Hatiseris. This name literally signifies sea-cabbage; from \(\dot{\alpha} \lambda \mathrm{s}\), the sea, and \(\sigma \varepsilon \rho \iota\), a sort of cabbage.

The broad membranous fronds are not unlike the leaves of cabbage.
2323. Encoelium. From \(\varepsilon v\), within, and kornos, hollow. The fronds are all tubular and bladdery

2324, Zonaria. Beautiful marine plants marked with transverse zones of lines, in which the organs of reproduction are supposed to exist.
2325. Laminaria. The reproductive organs of this genus are situated in the form of large sori upon the lamina of the frond. L. esculenta is eaten in Scotland, where it is called Badderlocks. From L saccharina, when dried in the sun, exudes a dry white sweetish substance, which is eaten as sugar by the poor inhabitants of Iceland. L. buccinalis furnishes the singular vegetable production called the sea-trumpet.

History, Use, Propagation, Culture,
2326. Lichina. So called in allusion to its supposed convertibility into some one of the Lichen tribe. Sir James Smith has made one species a Lichen and the other a Fucus.
2397. Furcellaria. Named on account of the dichotomous forked or furcellate arrangement of the fronds.
2328. Fucus. So called by the Greeks. In Latin, the word signifies paint of any kind; a pigment staining red is afforded by certain species of Fucus. Fucus vesiculosus is much employed in the manufacture of kelp. It is common in great variety upon all the sea-coasts of these islands. It is known at first sight by its spherical vesicles filled with air. When the plant is dried, it becomes brittle, and of a dull black color, and sometimes it is covered with a saline efflorescence. Medically it is considered deobstruent, and has been found efficacious in scrofulous swellings. (Thom. Lond. Disp. 308.)

15347 Frond flat with spherical tubercles
15348 Frond roundish with elliptical tubercles

\section*{15349 The only species}

15350 Stem compressed here and there inflated with internal vesicles, Receptacles lateral distic. stalk. pyriform 15351 Frond flat ribbed lin. dichotom. entire, Vesicles spherical innate upon frond in pairs, Recept. term. elliptical

15352 Frond lin. costate ent. somew. dichotom, without vesicles, Lateral segm. narrowest multif. fruit-bearing 15353 Frond linear entire dichotomous without vesicles ribbed, Receptacles linear-elliptical
15354 Frond dichotomous ribbed serrated, Recept. solitary flat serrated
15355 Frond linear nerveless channelled dichotomous, Recept. terminal
15356 Frond filiform somewhat dichotomous, Recept, terminal cylindrical
15357 Cup radic. circular plano-convex emitt. from its centre a frond terminat. in a very long dichotom, recept.
15358 Lvs, densely spiny all over, Vesic. ellipt. somew. term. crown. solit. Recept. warty from inflat. base of spines 15359 Lvs, filiform dichotom. unarmed, Vesicles lanceolate chained, Recept. terminal ovate ellipt. mucronate 15360 Lower leaves thin costate pinnate, Pinnæ lanceolate crenulate, Vesicles lanceolate somewhat solitary
15361 Lvs, unarmed filif. much branched, Vesicles innate ovate-elliptical somew. chained, Recept, filif. terminal
15362 Stem compressed pinnated, Leaves distichous fiat linear entire, some bearing vesicles, others receptacles

and Miscellaneous Particulars.
For rural economy, this and other species of Fucus are burned for their ashes, which produce the kelp or potash of commerce. On those shores of the sea where these plants do not abound, and where the water is sufficiently saline, the different species of fuci are raised artificially, by depositing stones at regular distances, on which the fuci spring up of themselves, and in four years yield a crop fit for cutting. Those who are interested on this subject will find ample information in the Transactions of the Highland Society of Scotland (vol. viii.), and in Headrick's Survey of Forfarshire. A condensed view of what is known on the subject will be found in the Encyclopædia of Agriculture in loco.
2329. Cystoseira. From zuбтis, a bladder, and \(\sigma\) ergo, a chain. The upper parts of the frond have the appearance of little bladders chained together.

Order 8.

\section*{IICHENS.}

Reproductive organs uniform. Sporules deposited in receptacles of various forms, distinct in substance from the thallus or frond, which is either pulverulent, crustaceous, membranous, foliaceous, or branched and shrub-like.
This, Algæ, and the collateral order Fungi, may be said to exhibit the lowest stage of vegetable developement, and to contain the simplest forms of which plants are susceptible. Indeed it seems that each is resolved into the other when in the least stage of composition. Of this order, the lowest tribe, Pseudo-Lichenes, are considered Fungi by some authors, and have been formed into a distinct order by others, under the name of Hypoxyla. Here it seems best to consider them Lichens.
The fructification is usually in the form of shields or cup-like receptacles (a), dispersed over the surface of the frond or thallus ( \(b\) ), and bearing various names according to their nature, Apothecia is the common term used to designate the fructification. Podetia are the stalk-like processes of the frond (c), which bear the apothecia on their summit. Scyphce are cup-like apothecia. Cyphellae are pale tubercular spots on the under side of the frond, Lacunce are small hollows or pits on the upper surface of the frond. Soredia are little heaps of free, pulverulent bodies, mostly of a whitish color, placed on various parts of the frond (e). Pulvinuli are spongy, ex-crescence-like bodies arising from the frond, and often resembling minute trees. Nucleus proligerus, or kernel, is a distinct cartilaginous body coming out entire from the apothecia, and containing sporules, Lamina proligera is a distinct body containing tice sporules, separating from the apothecia, often very convex and variable in form, and mostly dissolving into a gelatinous mass. The arrangement of Acharius, which is the most celebrated, is here followed.

\section*{Tribe I. IDIOTHALAMI.}

\section*{Apothecia differing in color from the rest of the plant, and formed of a distinct substance,}

\section*{\$ 1. Apothecia simple, entirely formed of a sub-uniform, pulverulent, or cartilaginous substance. Homogenir. \\ * Apothecia destitute of a raised margin.}
2330. Spiloma. Plant crustaceous, spreading, plane, adnate, uniform. Apothecia composed of minute bodies, collected into a compact, homogeneous, subpulverulent, naked, and shapeless colored mass,
2331. Solorina. Plant foliaceous, coriaceous, lobed, separate beneath, and veiny or fibrous with down. Recept. adnate, roundish, not edged, covered by a colored membrane, and containing a solid, cellular, bladdery parenchyma.

\section*{** Apothecia with a raised border.}
2332. Lecidea. Plant various, crustaceous, spreading, adnate, and uniform or foliaceous. Apothecia scutelliform, sessile, surrounded by a cartilaginous membrane; the disk of the same nature as the raised border.
2333. Calicium. Plant crustaceous, plane, spreading, adnate, uniform. Apothecia cup-shaped, sessile, or stipitate, cartilaginous, containing a compact pulverulent mass, plane or convex, and forming a naked disk.
2334. Gyrophora. Plant foliaceous, coriaceous, or cartilaginous, peltate, mostly monophyllous, free beneath. Apothecia subscutelliform, sessile, or adnate, covered with a black cartilaginous membrane; the disk warty or plaited in circles, and bordered.
82. Apothecia subsimple, included, formed of a single covering, containing a capsular body or nucleus. Heterogenir.
2335. Endocarpon. Plant crustaceous, adnate, of some determinate figure, or foliaceous and peltate. Apothecia globose, concealed in the substance of the plant, surrounded by a thin membrane, furnished with a slightly prominent orifice, and containing a nucleus.

\section*{Tribe II. CGENOTHALAMI.}

\section*{Apothecia partly formed from the substance of the plant.}

8 1. Apothecia included in wart-like processes, formed from the substance of the plant. Phymatoider.
2336. Thelotrema. Plant crustaceous, cartilaginous, plane, spreading, adnate, uniform, with wart-like reccptacles, furnished with a wide pore, and bordered. Apothecia included, and containing a nucleus within a double covering.
2337. Pyvenula. Plant crustaceous, plano-expanded, adnate, uniform. Recept. wart-like, formed of the thallus, enclosing or surrounding at the base a solitary thalamium, with a simple, thick, papillose perithecium, containing a globose cellular nut.
2338. Variolaria. Plant crustaceous, plane, spreading, adnate, uniform. Apothecia wart-like, forme from the crust (resembling soredia), submarginate, white, including a naked nucleus.

\section*{6 2. Apothecia scutelliform, subsessile, the disk of a peculiar color different from the border, which is formed from} the crust. Discoinei.
2339. Urceolara. Plant crustaceous, spreading, adnate, uniform. A pothecia shield.like, the disk concave, colored, immersed in the crust ; border formed from the crust, and the same color.
2340. Lecanora. Plant crustaceous, spreading, adnate, plane, uniform. Apothecia shield-like, thick, adnate, and sessile, the disk plano-convex, colored; border thickish, somewhat free, formed from the crust, and the same color.
2341. Parmelia. Plant foliaceous, between coriaceous and membranaceous, spreading, appressed, orbicular, lobed, and stellate, variously divided, fibrous beneath. Apothecia shield-like, attached by a central point; the disk concave, colored, with a border formed from the crust.
2342. Borrera. Plant cartilaginous, branched, and laciniate, the segments free, channelled beneath, and ciliate at the margin. Apothecia shield-like, with a colored disk; the border formed from the frond.
2343. Cetraria. Plant cartilagino-membranaceous, ascending or spreading, lobed, smooth, and naked on both sides. Apothecia shield-like, obliquely adnate with the margin, the disk colored, plano-concave; border inflexed, derived from the frond.
2344. Sticta. Plant foliaceous, coriaceo-cartilaginous, spreading, lobed, free and pubescent beneath, with little cavities or hollow spots. Apothecia shield-like, fixed by a central point, the disk colored, plane; border formed from the crust.
2345. Peitidea. Plant foliaceous, coriaceous, spreading, subadnate, lobed, with woolly veins beneath. Apothecia orbicular, adnate, on produced portions of the frond, the disk colored; border very thin, formed from the frond.
2346. Nephroma. Plant foliaceous, coriaceous, membranous, expanded, lobed, beneath separate, and naked or villous. Recept. resupinate, formed of the ascending lengthened lobes of the thallus. Fertile lamina reniform, entirely attached to the thallus and its lower side, and surrounded by an elevated inflexed margin.
2347. Roccella. Plant coriaceous, cartilaginous, branched, laciniated, round or flat, erect or pendulous, woolly inside. Recept. shield-like, thick, growing into the thallus. Fertile lamina forming a disk, plano-convex, colored, and cartilaginous, in the inside hyaline, and of a similar nature, surrounded by a margin, which is elevated, sessile, and as deep as the disk, and which contains a compact black powdery mass, which is hidden within the substance of the thallus.
2348. Evernia. Plant branched, laciniate, angular, or compressed, suberect or pendulous, with a central filament within. Apothecia shield-like, sessile, the disk concave, colored; border formed the frond.
83. Apothecia subglobose, terminating the branches or podetia, or scattered, sessile, and emarginate. CEPHALOLDEI.

\section*{* Apothecia covered by the mass of the fructification.}
2349. Cenomyce. General receptacle subcartilaginous, foliaceous, laciniate, subimbricated, free (rarely adnate, uniform, or wanting). Apothecia on podetia, orbicular, immarginate at length, capituliform, bearing thick colored masses of fructification.
2350. Bacomyces. Plant crustaceous, spreading, plane, adnate. Apothecia on short, soft, solid, simple podetia, capituliform, solid, immarginate, colored, convex, reflexed at the margin.
2351. Isidium. Plant crustaceous, plane, spreading, adnate, uniform. Apothecia on very short solid podetia, orbicular, convex, solid, terminal; the disk subimmersed, having a border formed from the substance of the podetia.
2352. Stereocaulon. Plant shrubby, cartilaginous, branched. Apothecia turbinate, sessile, solid, plane above, at length subglobose, with a border formed from the frond.

\section*{** Apothecia clothed with the substance of the frond, and containing a pulverulent mass.}
2353. Sphaxophoron. Plant cartilaginous, fibrous within, solid, shrubby, branched. Apothecia sessile, terminal, subglobose, bursting irregularly, and containing a black, globular, pulverulent mass.

Tribe III. HOMOTHALAMI.
Apothecra entirely formed of the substance of the frond, and of a similar color.
2354. Alectoria. Plant cartilaginous, subfiliform, fibrous, and somewhat fistulose within, branched, prostrate, or pendulous. Apothecia shield-like, thick, sessile, bordered, wholly formed from the frond.
2355, Ramalina. Plant cartilaginous, fibrous, and nearly solid within, branched, somewhat shrubby, mostly sorediferous. Apothecia shield-like, thick, subpedicellate and subpeltate, plane, bordered, wholly formed from the substance of the frond,
2356. Cornicularia. Plant cartilaginous, fibrous, and nearly solid within, branched, shrubby. Apothecia orbicular, terminal, obliquely peltate, at length convex, somewhat inflated; the border dentate.
2357. Usnea. Plant much branched, filiform, mostly pendulous, furnished within with a bundle of elastic fibres. Apothecia orbicular, terminal, peltate, often ciliate at the border.
2358. Collema. Plant subgelatinous, homogeneous, crustiform, foliaceous, or somewhat branched, membranaceous or cartilaginous when dry. Apothecia shield-like, bordered, formed from the substance of the frond; the disk sometimes differing in color when dried.

\section*{Tribe IV, aTHALAMI.}

\section*{Lichens destitutc of apothecia, and whose fructification is unknown.}
2359. Lepraria. Whole plant crustaceo-pulverulent, spreading, adnate, uniform. Apothecia unknown.

\section*{Tribe V. PSEUDO-LICHENES.}

Apothecta black, corneous, imbedded in a receptacle. Sporules in slender tubular cells, lying an a mulp, not spontaneously emitted.
2360. Opegrapha. Plant crustaceous, flat, expanded, adnate, uniform. Receptacle oblong and elongated, sessile, covered with a cartilaginous dark membrane, enclosing a solid parenchyma, Disk linear, edged on each side.
2361. Verrucaria. Plant crustaceous, plane, expanded, adnate, uniform, Recept, hemispherical, roundish at the base, growing into the thallus, with a double perithecium; exterior somewhat cartilaginous and thick, having above a little pimple or perforation; inner very fine, and membranous. Kernel cellular.
2362. Porina. Plant crustaceous, cartilaginous, plano-expanded, adnate, uniform. Recept. wart-like, formed out of the thallus, and not margined. Thalamium imbedded in the substance of the wart, with a simple very thin perithecium, and a colored orifice thicker at the surface of the wart. Kerne! roundish, cellular.
2363. Arthonia. Plant crustaceous, plano-expanded, adnate, uniform. Recept. innate, sessile, of an irregular roundish figure, without an edge, covered by a somewhat cartilaginous membrane, and containing a solid uni form kernel.
2364. Graphis. Plant crustaceous, plano-expanded, adnate, uniform. Recept. long, immersed in the thallus, with a simple cartilaginous perithecium, which forms an edge all round the linear kernel, which is naked at top and bottom, and cellular inside.

2350. Spilorra. This word signifies in Greck, a spreading discoloration of the cuticle, and well expresses the general character of the genus.

\section*{IDIOTHALAMI.}

15363 Crust somewhat cartilaginous whitish, Apothecia crowded tumid oblong varying in figure roughish reddish at length brownish black and somewhat pruinose
15364 Crust somewhat cartilaginous powdery cracked variegated with cinereous and yellow, Apothecia immersed superficial roundish finally confluent
15365 Crust very thin glauc. Apothecia burst. forth min. convex cluster, and conflu somew, branch. dark-color. 15366 Crust very thin greyish, Apothecia flat diluted irregular somewhat confluent black
15367 Crust spread. widely very thin membran. greyish, Apothecia dot-like very min. black lead-color. when dry 15368 Crust obsolete or white, Apothecia very minute black confluent without bristles
15369 Crust filmy very thin green. grey, Apothecia mostly dispers. hemispher. sooty : internally yellowish green 15370 Crust spreading widely very thin; for the most part membranous greyish white, yellowish green when rubbed, Apothecia minute tlat confluent blueish grey
15371 Crust thin somew. powd. white, Apoth. scatter. min. dotlike solid black with superfic. dark-brown powder 15372 Crust tartar. rugg. greyish-white cracked, Apothecia convex round. very black : their centers often decid. 15373 Crust tartar. rugged greyish or greenish-white, Apothecia convex rounded black orange-colored within 15574 Crust calcareous greenish-white, Apothecia scattered somew. confluent unequal elevaled granulat. black

15375 Thallus green. (brown when dry) lobed: ben, veiny and of a fine saffron-col. Apothecia somew, tum. brown 15376 Thallus lobed grey,-green whiter and fibrous ben. Apothecia at length sunk into deep pits or hollows brown
\[
\dagger \text { Thallus crustaceous reniforn. }
\]
* Apothecia constantly black, naked, (not pruinose).

15377 Crust tessellated greyish-black smooth, Apothecia several together depressed brownish-black with a paler border, at length crowded elevated the border being obliterated
15378 Crust continued tessellat. greyish-black, Apothecia immersed between the areolæ plane at length convex somewhat angular black of the same color within
15379 Crust spreading very thin cracked black with swelling whitish scattered areolæ, Apothecia plane or slightly convex often in the interstices black, of the same color within
15380 Crust very thin black cracked and tessellated areolæ chesnut-brown plane marginated shining scattered, Apothecia rather convex black margined white within
15381 Crust subcartilaginous tessellat. smoothish brownish grey, Apothecia buried in the crust plane margined at length convex clustered and losing their margin black within greyish-black
15382 Crust tartareous cracked whitish ash-color, Apothecia within the spaces of the crust depressed flat finally convex somewhat confluent dark with a thin edge
15383 Crust thin roundish very finely cracked somewhat powdery white, Apothecia grown into the crust thick protuberant somewhat concentrical dark-colored with a tumid elevated contracted margin
15384 Crust tartareous somew. spreading tessellated nearly even greyish-brown, Apothecia sessile at length irregular convex subglobose confluent black emarginate within having a thin greyish stratum ben. disk
15385 Crust thin sulmembranaceous greyish-white bordered with black at length spreading somew. granulated, Apothecia nearly plane sessile margined black blackish within
15386 Crust rugose and warted greyish-white, Apothecia at length convex hemispherical somew. tuberculated black horny and black within having beneath a powdery bright red stratum
15387 Crust scattered granular irregularly lobed cinereous whitish, Apothecia clustered convex sessile planoconvex hemispherical somewhat confluent dark powdery inside
\(\beta\) Crust scattered granular somewhat cohering white cesious or cinereous brown, A pothecia hemispherical somewhat globose often clustered shining
15388 Crust tartareous broken into cracks with wart-like smooth cracked cinereous areolæ, Apothecia deepiy immersed convex aggregate scarcely edged dark-colored
15389 Crust tartareous brownish ash-colored composed of granulated warts, Tubercles convex irregular black with an obsolete black border
15390 Crust somewhat cartilaginous scaly granular glaucous cinereous, Granules flattish crenulated, Apothecia sessile plano-concave erged finally wavy
15391 Crust rugose somewhat granular ferruginous ash-colored, Apothecia superficial flat edged finally fexuose and convex, Edge finally obliterated
15392 Crust spreading thin black scattered with plareish subcontiguous bright-yelfow areolæ, Apothecia plane or slightly concave black of the same color within
\(\beta\) Areolæ brightyellow plane angular black between and with a black margin
15393 Crust tartareous tessellated yellowish-red, Apothecia sessi'e plane at length convex irregular confluent black internally cemuous and black
15394 Crust granulated and tessellated somewhat pulverulent ochraceous red, Apothecia minute elevated with the margin tumid: the disk depressed black nearly of the same color internaily

and Miscellaneous Paticulars.

15395 Crust membranaceous white with a greyish or whitish-grey powdery substance scattered over it in small clusters, Apothecia minute appressed plane black
15396 Crust leprous granul. powdery green,-yell. Apothecia sess, margin. finally convex dark : of same col. inside 15397 Crust granular somewhat gelatinous greenish-brown, Apothecia appressed margined finally hemispherical clustered dark: of the same color inside
15398 Crust globose warted powdery cinereous yellowish, Apothecia convex scabrous

\section*{** Apothecia black, naked : when moistened becoming-red or brown.}

15399 Crust thin whitish, Apothecia plano-convex immersed in the stone margined dark: disk pruinose ; when moistened crimson, white inside
15400 Crust cracked into areolæ brownish ash-color edged with dark lines, Apothecia sessile fat becoming convex edged irregular black

\section*{*** Apothecia black with a grey bloom.}

15401 Crust tartareous contiguous even at length somewhat tessellated and whitish, Apothecia sessile and elevated plane black with a grey bloom and a black smooth border
\(\beta\) Crust of a regular figure contiguous whitish cæsious, Apothecia immersed : disk depressed hollowish
15402 Crust spreading very thin smooth glaucous: fructification subsessile plane black with a grey bloom; the border raised and swelling
15403 Crust tartareous contiguous very white, Apothecia sessile thick black powdery margined becoming convex with an ash-colored layer under the disk
15404 Crust tartareous defined tessellated white areolæ swelling, Apothecia sessile hemispherical with a grey bloom black within with a thin persistent margin
15405 Crust somewhat tartareous granular areolated uneven very white, Apothecia minute somew. immersed cæsious becoming subglobose not margined dark cinereous inside
15406 Crust thick greyish-white cracked rugose at length mealy very white within, Apothecia numerous scattered minute: at first prominent and pale-brown; then concave and black
**** Apothecia blach-brown, brownish, or deadened by some other color.
15407 Crust somewhat effuse granular cinereous greenish, Apothecia appressed flat dark-brown : inside dirtywhite with a thin fexuose edge paler than the disk
15408 Crust lep. granul. pale yellow,-brown, Apoth. somew. immers. becom. conv. not margin. brown and black 15409 Crust thin granulat. somew. farin. green or green.-brown : fructific. conv, rug. irregul. conflu. black.-brown 15410 Crust spread. leproso-farin. soft uneven glauc. green, Apothecia scatter. sess. brown with marg. ent. paler 15411 Crust tartareous cracked and broken uneven smoothish pale sulphur-color, Apothecia adnate plane scarcely margined brown and scarcely paler in the margin, at length irregular and convex
15412 Crust cracked areolated uneven somewhat powdery sulphureous, Apothecia minute sessile convex not margined whole-colored becoming hemispherical
15413 Crust granulated greyish-white, Granules becoming pulverulent, Apothecia nearly plane red fleshcolored livid or brown with the elevated margin paler, at length flexuose

15414 Crust firmer granulat. and subpapill. Apothecia at length hemispheric. rug. brown.-black and black conflu. 15415 Crust thin tartareous contiguous greyish-white, Apothecia immersed plane margined, at length convex : the margin persistent glabrous reddish-brown; of the same color within
15416 Crust thin whit. cover. with somew. globul. pale gran. at length grey. Apoth.sess, becom. conv. yel..brown
\(1541 \overline{7}\) Crust thin membranous hoary finally granular powdery, Apothecia sessile concave thick tumid brown flesh-colored with an edge of the same color
\(\beta\) Crust very thin naked whitish, Apothecia flattish scarcely margined waxy purple brown and black 15418 Crust spreading very thin membranaceous white or greyish somew. shining subgranulose, Apothecia plane yellow-brown, at length red-brown with the margin paler elevated, at length flexuose
15419 Crust thin somewhat cracked uneven greyish-white: fructification plane, at length angular and irregular yellowish or reddish-brown ; the border narrow persistent
15420 Crust spreading somewhat scaly uneven roughish darkish-brown, Apothecia minute plane reddish yellow with the margin paler, at length somewhat convex and brownish

\section*{***** Apothecia dark-red, or whitish flesh-color.}

15421 Crust tessellated rugose darkish-grey, Apothecia plane rusty orange : the margin sometimes crenulate, at length convex with the margin obsolete blackish-red
15422 Crust leprose uneven somewhat granulated greenish-white, Apothecia nearly sessile plane flesh-colored, at length waved roughish in the disk : margin scarcely any
15423 Crust thin grey.-white, Apothecia somew. glob. at length urceol. white : disk flesh-color. ; marg. tum. ent. 15424 Crust thin smoothish minutely granulated greyish-white, Apothecia slightly convex entire whitish rosecolor paler at the margin
****** Apothecia pale, yellowish, waxen or orange-colored.
15425 Crust thin white powdery, Apothecia plano-convex smooth edged pale-yellow
15426 Crust cartilaginous cracked rugoso-plicate granulated white or greenish, Apothecia nearly sessile plane at length slightiy convex waved unequal clustered pale yellowish
15427 Crust subtartareous tessellated pale, Apothecia nearly plane with, the margin lobed waved clustered, at length subglobose destitute of margin yellowish flesh-color

History, L'se, Propngation, Culture,
2333. Calicium. From zaduxay, a little cup, well expressing the sppearance of the organs of reproduction. All the species form grey, white, or yellow patches, of various extent, on old wroughi wood, or boards exposed to the weather.
2334. Gyrophora. So named, from gu@os, a circle, and \(\psi^{*} \xi \omega\), in allusion to the concentric circles, more or less

15428 Crust thin leprose powdery soft pale green.-yellow, Apothecia slightly convex pale yellowish : marg. obsol. 15429 Crust thin effuse somew. granul. black, Apothecia min. cluster. flat yellow. with an elevat. ent. paler marg. 15430 Crust thin smooth. white, Apoth. crowd. at length convex hemispher. margin. orange-color. white within \(\dagger\) Thallus crustaceous, of a regular figure or leaf. Lepidoma.
15431 Crust somewhat imbricated white hoary, Lobes crenate reflexed tumid, Apothecia appressed black glaucous; edge finally wavy
15432 Crust somewhat imbricated brownish-black covered with a greyish powder, Lobes entire swelling, Apothecia black naked, at length hemispherical with the margin obsolete
15433 Crust imbricat. green.-brown, Lobes round. cren. paler ben Apothecia plane, at length somew. conv. black
15434 Crust somewhat contiguous lobed areolate and imbricated cinereous brownish-lurid, Lobes becoming flexuose cut-crenate, Apothecia appressed not edged flattish finally confluent
15435 Crust imbricated pale olive-green, Lobes distinct reniform nearly erect beneath and the margin powdery, Apothecia plane margined glaucous black
15436 Crust indeterminate very thin fibrous black with white convex crowded smooth warts, Apothecia solitary in each wart depressed coal-black with a border of the same color
15437 Crust somewhat imbricated, Lobes rounded crenate livid-brownish white beneath surrounding the apothecia, which are hemispherical clustered reddish not margined
15438 Crust subimbricated, Lobes distinct subpeltate roundish flesh-colored and red brown whitish beneath, Apothecia in their border convex and subglobose black : margin obsolete
15439 Crust imbricated glaucous white, Lobes minute rounded convex, Apothecia convex rufous brown becoming blackish: margin thin entire
15440 Thallus slightly imbricated fragmentary grey,-green on a dense black fibrous cushion : its segm. somewhat linear lobed crenate and granular at the margin, Apothecia scattered tawny paler at the.marg. at length convex brown obliterating the margin
15441 Crust orbicul. rugose plait. hoary lobed-plait. in circumfer. Apothecia central plano-convex dark-colored 15442 Closely imbricated radiated membranous very smooth brownish-grey pale with black fibres below : its segments linear obtuse undulated, Apothecia black with a black border of their own substance
15443 Crust areolated-warted smoothish wavy, Apothecia sessile dark opaque, Disk flat tumid at edge
15444 Crust somewhat contiguous unequal whitish or none, Apothecia sessile subglobose dark smooth: disk dot-like becoming flattish with a thin shining margin
15445 Crust somewhat tartareous contiguous wrinkled olive-green, Apothecia roundish dark shining: disk depressed opaque, and stalks short whole-colored
15446 Crust effused greyish somewhat pulverulent : fructification subglobose, at length flattened greyish-black with a cylindrical thickish-black peduncle
15447 Crust very thin grey, smooth, Apothecia subglob. : disk dark-brown; margin greyish, Stripes filif. black
15448 Crust cartilaginous areolate rugose smooth yellow-green, Apothecia lentiform ferruginous powdery, Stems short cylindrical dark-pitch color thicker at base
15449 Crust lemon-yellow granulated and conglomerated: fructification subturbinate; disk brown convex, the border yellow and pulverulent, Peduncle filiform blackish and shining at the base
15450 Crust thin white ash-color. Apothe, becom. lentif. : disk black.-brown ciner. pruin. with a yell.-green marg. 15451, Crust thin whitish powdery, Apothecia lentiform : disk flesh-colored becoming brown powdered, Stalks filiform naked pale becoming brownish or black
15452 Crust effuse powdery greenish-yellow, Apothecia globose, and stalks filif. very long flexuose yellow.-green
15453 Crust leprous powdery pale yellowish-green, Apothecia hemispherical globose and stalks tapering upwards straight powdered with fulvous
15454. Crust thin granulated tartareous rusty white, Apothecia on short stalks thick black often compound with a pale rusty disk
15455 Crust white granulat. Tuber. a little prominent round flatt. gray.-black powdery with a smooth black edge 15456 Crust granulated smooth greyish-white, Tubercles scattered roundish black polished wrinkled irregular without a border mostly sessile
15457 Crust membran. very thin white, Tuber. black convex with recurv. marg. on long slend. wavy black stalks 15458 Crust thin tartareous somewhat granulated of a verdigrease-grey, Apothecia on slender black stalks black hemispherical with a convex brownish-black disk
15459 Crust filmy very thin whitish, Apothecia on thickish black stalks obovate or hemispherical black with black prominent loose powder
15460 Thallus smooth blackish-green : ben, smooth black and naked, Apothecia at length conv. rough and plait.
\(\beta\) Thallus of many lvs. or lobes variously fold. black.-green quite black ben. on each side naked and smooth.
15461 Thallus membranaceous with elevated reticulations, at length of a smoky ash-color rough smoother paler and subfibrillose beneath, Apothecia turbinate, at length convex variously plaited
\(\beta\) Thallus thick hard rigid with elevated dots rugose olive-brown becoming black naked smooth paleyellow beneath, Apothecia globose
15462 Thallus somewhat naked dark greenish-grey folded and lobed strongly ciliated beneath smooth pale with branching fibres, Apothecia elevated nearly plane with concentric and plaited lines

\section*{and Miscellaneous Particulars.}
complicated, observable in the disk of the receptacles of the shields. The species grow chiefly upon exposed alpine rocks, chiefly on granite or voleanic stones. The vitrified forts in the Highlands of scotland produce some of them.

\section*{CENOTHALAMI.}

History, Use, Propagatton, Lulture,
2335. Endocarpon. From Evठov, within, and \(x \propto \rho \pi о 5\), fruit, because the receptacles of the sporules are deeply imbedded in the substance of the frond. The species form small roundish or angular plants, commonly closely sessile upon earth or stone; of a grey or olive hue; their fructification appearing like little black dots over the surface.
2336. Thelotrema. From \({ }^{2} \eta \lambda \eta\), a nipple, and \(\tau \rho \eta \mu \propto\), an orifice. The protruberances of the thallus are perferated. This genus has been reduced to Endocarpon by Sir James Smith.

15463 Thallus rugged olivaceous brown, its circumference perforated and laciniated dark-grey : beneath glabrous somewhat granulated and fibrous, Apothecia somewhat convex variously plaited
15464 Thallus roughish olivaceous brown with a brown scattered dust smooth beneath with pits and reticulations naked of the same color, Apothecia plane with circular plaits, at length convex
15465 Thallus blistered and warty greenish ash-color ben. deeply pitted smooth palish-brown naked, Apothecia few plane margined : disk somewhat even papillose and plaited
15466 Thallus smooth sinuato-lobate of a greenish coppery-brown: beneath black with dense pulvinate fibres, Apothecia sessile, at length somewhat globose variously plaited intricate
15467 Thallus very rig. mouse-col. ben. black.-brown rough with elevat. paler spots, Apoth. conv. various. plait.
15468 Thallus crustaceous cracked into areolæ figured somewhat lobed greenish rubiginous depressed at the circumference, Orifices depressed black
15469 Thallus crustaceo-cartilaginous somewhat foliaceous minute subpeltate appressed plane roundish entire yellow-green, Orifices of the apothecia depressed reddish-brown
15470 Thallus crustaceous submembranaceous spreading and subfoliaceous contiguous wavy cracked glaucous ash-col. irregul. lob. and crenat. at marg, ben. black somew, spongy, Orifi, elevat. conv, black perforat.
15471 Plant subcartilaginous roundish or somewhat angular lobed of an olive-green : beneath pale at margin; the rest blackish and fibrillose, Orifice of the fructification subprominent dark-brown
\(\beta\) Lobes of thallus aggregat. somew. imbricat. : margin elevated repand-lobed wavy with black wool beneath
15472 Thallus coriaceous membranous pallid leafy greenish crenate-lobed becoming irregularly ragged, Orifices hemispherical pale with a black dot
15473 Thallus coriaceous convex rounded lobed copper-colored, at length rugged black and shaggy beneath, Orifices scattered sunk minute coal black, at length convex
15474 Thallus thiok crustaceo-cartilaginous foliaceous orbicular peltate greyish spread at marg. somewhat lobed and waved beneath smooth, at length rugose and tawny, Orifices minute slightly prominent brownish
15475 Thallus cartilaginous foliaceous orbicular peltate brown or greyish: the border spread and wavy smooth naked rough and black beneath, Orifices of the apothecia very minute slightly prominent black
15476 Thallus coriaceo-cartilaginous lobed greyish : beneath brownish-black; the lobes nearly erect rounded plicate and convolute, Orifices of the apothecia numerous convex black
15477 Thallus cartilagineo-coriaceous lobed greenish-brown olivaceous: beneath rather tawny or blackish on both sides smooth; the lobes laciniated waved plaited and crisped crowd. Orifices rather convex black

\section*{CENOTHALAMI.}

15478 Crust smooth whitish, Warts of the apothecia smooth somewhat cone-shaped with the margin of the aperture thin simple somew. inflexed and contracted covered at bottom with a membrane which bursts
15479 Crust subtartareous thin contiguous greyish, Warts of the apothecia convex half immersed whiter, Orifices much contracted radiated with fissures concealing the flesh-colored apothecia
15480 Crust nearly regular smooth rugulose cinereous, Warts of apothecia clustered irregular whitish with a large black aperture and a thick somewhat angular lacerated edge
\(\beta^{\prime}\) Crust white powdery with granul and min. soredia, Warts of apothecia appres. few and immers, in crust
15481 Crustaceous cream-colored with scattered rather convex warts opening by an irregular inflexed orifice, A pothecia immersed depressed brown
15482 Crust cartilaginous uneven somewhat polished greenish-grey, at length extremely tumid and uneven, Apothecia elevated crowded hollow very irregular
15483 Crust cartilaginous membranous polished pale brownish cinereous, Warts of apothecia closed closing surrounding the upper projecting part of the thalamium
15484 Crust tartareous somewhat tessellated unequal brownish-black, Warts of the apothecia spreading at the base depressed somewhat rugose surrounding the greater part of the prominent apothecia
15485 Crust tartareous unequal cracked into areolæ cinereous yellowish, Warts of apothecia enlarged at their base ilepressed closed clustered about the edged orifice
15486 Crust tartareous regular finely cracked cinereous rufous, Warts of apothecia smooth reddish depressed above forming a margin to the papilla-like prominent orifice
15487 Crust determined somewhat cartilaginous smooth very white plaited in rays, Warts of apothecia polished compressed tumid: kernel covered with a thin powdery skin
15488 Crust subcartilaginous cracked into areolæ granular cinereous, Warts of apothecia convex clustered granular: kernel lentiform enclosed
15489 Crust subcartilaginous greyish uneven with granules and soredia scattered in an irregular manner, Warts of fructificat. subglob. smooth, at length depressed above and soredifer. and contain. a concave nucleus

and Miscellancous Particulars.
2337. Pyrenul.x. A diminutive of \(\pi \int_{\xi}\) g\%, a kernel; in allusion to the manner in which the receptacle is enclosed in the thalamium, as a kernel within its shell. Crustaceous plants, found chiefly upon the bark of trees.
2358. Variolaria. The shields of these plants resemble the eruptive spots of the variolæ ur measles. The whole genus was referred by Linnæus to his Lichen fagineus and lacteus. The species are of a crustaceous nature, found upon the trunks of trees, rocks, walls, or the ground.

History, Use, Propagation, Culture,
2339. Urceolaria. From urceolus, a little pitcher, with reference to the form of the shields, which are sunken in the crust. Natives of hard stones occasionally inundated, or upon naked exposed rocks; occasionally upon the trunks of trees. The crust of \(\mathbf{U}\). esculenta, a native of Tartary, is eatable.
2340. I.ecanora. An unexplained name. Lecanora perellus affords a purple dye, and is called in the south of France, where it is employed in lieu of the L. tartarea, Pcrelle d'Auvergnc, whence the specific name, as Smith

15490 Crust cartilaginous polished whitish becoming unequal and ash-colored scattered with white soredia having no margin, Warts of apothecia spheroidal powdery
\(\beta\) Crust tartareous cartilaginous determined glaucous with a polished radiated cracked circumference, Soredia scattered superficial flat not margined
15491 Crust rugose cracked uneven subpulverulent white or greyish, Warts of the apothecia appressed planoconcave margined bearing soredia of the same color as the crust
\(\beta\) Crust pulverulent white, at length greyish naked, Soredia crowded, at length spreading waved planoconcave with the margin raised swollen
15492 Crust tartareous distinctly bordered cracked smooth white: the circumference somewhat zoned crenatolobate, Warts of the apothecia crowded margined very white and pulverulent
15493 Crust elliptical thin slightly tartareous rugged grey scarcely limited, A pothecia rounded with a narrow border, Powder greenish
15494 Crust tartareous thickish greyish-white cracked tumid papillary and rugged obscurely zoned at the circumference, Apothecia orbicular prominent white
15495 Crust orbicular tartareous thin ash-colored cracked: its circumference indeterminate, Apothecia orbicular very small white with an elevated margin and flesh-colored disk

15496 Crust with a rather decided edge smooth with narrow cracks pale brick-colored: disk redd. ; marg. tum.
\(\beta\) Crust bordered smooth tessellated reddish, at length white, Apothecia becoming elevated with the disk rather convex reddish-brown reaching the margin of the crust
15497 Crust papillose warted polished white ash-color: disk concave black immersed in the tip of the warts, Border contracted protuberant crenated entire
15498 Crust cracked areolate warted cinereous bordered with black: disk somewhat concave dark immersed among the warts becoming elevated, Border thickish projecting
15499 Crust rugoso-plicate granulated white or greyish: fructification urceolate; the disk black, the border swelling inflexed subrugose covering the disk
15500 Crust continued calcareous smooth brownish-white irregularly cracked when dry, Apothecia very minute blackish sunk in the crust
15501 Crust determined finely cracked somewhat powdery very white becoming cinereous : disk minute concave black powdered with white, Border prominent discoid thin
\(\beta\) Crust thin cracked into areolæ equal dull ash-colored, Fertile areolæ raised in the middle whitish leadcolor: disk somewhat concave dark cæsious powdery

> + Thallus adnate uniform. RinoDiNA.
> * Disk of apothecia constantly dark and black.

15502 Crust with a somewhat decided edge granulated and cracked greyish-white, Disk of the apothecia plane at length swelling and black: the margin free raised, at length waved and crenulate
15503 Crust smooth uneven warted pale, Warts at length subimbricated somewhat lobed and deformed, Dish of the fructification concave brownish-black: the border sharp crenulate contracted
15504 Crust glab. papill. and branch. white, Apothecia sess. scattered : disk slightly concave black; marg. tumid
15505 Crust effuse thin cracked rugose unequal cinereous, Disk of apothecia somewhat immersed finally elevated flat dark with an elevated inflexed powdery border
15506 Crust thin somewhat leprous and dispersed whitish, Disk of apothecia plano-convex dark dotted rough. Border obscure powdery
\(\beta\) Crust uneq. obscure. ciner, black. Apothecia min, aggreg. flat with a white cren. border and brown, edge
** Disk of apothecia black, naked, brownish when moistened.
15507 Crust verrucose-granular from cinereous brownish-green, Apothecia heaped with a flat coarse dark disk brown when moistened, Border tumid inflexed entire
*** Disk of apothecia black, brown, brownish, or clouded with other colors, naked
15508 Crust cartilaginous smooth, at length granulated unequal white or greyish, Disk of the apothecia pianoconvex brown or almost black: margin tumid entire, at length waved and crenate
15509 Crust tessellated with tumid warts yellow green or grey, Apothecia appressed, at length irregular with the disk plane or swelling red brown, at length rising above the entire margin
15510 Crust tartareous very much cracked variegated with black and white (yellowish-white in dispersed tumid warts), Apothecia pale-brown, at length convex dark-brown : margin white
15511 Crust effuse thin powdery cinereous æruginous, Apothecia minute appressed : disk flat becoming convex pale-brown, Border thin obscure
15512 Crust thin leprose white, Apothecia crowded elevated: disk plane olive; the margin waved
15513 Crust unequal granular somewhat warted pale-green, Apothecia clustered: disk flat pale-brown and variegated, Border raised inflexed finally crenulate
15514 Crust elfuse very thin polished whitish sometimes bearing soredia, Apothecia sessile; disk flattish pale livid-brown, Border pale becoming crenulate

and Miscellaneous Particulars.
tells us, though generally spelled Parellus. L. Turneri is probably only a variety growing upon the bark of trees.
Lecanora candelaria derives its name from the circumstance of the Swedes employing it to stain the candles that are used in their religious ceremonies.

Lecanora tartarea is the famous Cudbear (so called after a Mr. Cuthbert, who first brought it into use)

History, Use, Propagation, Culture,
employed to produce a purple for dying woollen yarn; and no where, perhaps, used to so great an extent as in
the manufactory of Mr Mackintosh, at. Glasgow. The manufacturers import it largely trom Norway, where

15515 Crust cracked and areolate somewhat granular whitish, Disk of apothecia rufous becoming brown, Border white or yellowish becoming flexuose
**** Disk of apothecia black, casious, glaucous, or variously colored, always pruinose.
15516 Crust greenish ash-color with roundish warts, Circumference fibrous, Apothecia mixed: disk concave becoming flat blackish-glaucous; border elevated thick
15517 Crust tartareous tessellated even greyish-white, Apothecia immersed in the crust : the disk plane, at length convex subglobose glaucous and powdery; margin entire afterwards obliterated
15518 Crust cartilaginous membranous whitish ash-color, Apothecia clustered minute: disk flat becoming convex variegated with brown and black ; border entire naked persistent
\(\beta\) Crust becoming unequal somewhat granular ash-colored or blackish, Apothecia much clustered : disk flat brown and black; border crenulate powdery
15519 Crust thin leprous continuous cream-colored somewhat polished, Apothecia sessile whitish-buff uneven with a thin white wavy border
***** Disk of apothecia somewhat flesh-colored, pale, testaceous, waxen, or orange-colored.
15520 Crust granulated or somewhat warted white, Apothecia thick crowded by pressure angular: the disk concave, and as well as the tumid entire margin of the same color as the crust
15521 Crust very thin membranaceous smooth glaucous white bearing awl-shaped bristles, Disk of the apothecia at length spreading plane pale-yellowish
15522 Crust leprous granular powdery whitish-grey, Apothecia scattered thick powdery : disk concave pale flesh-colored; border tumid entire and flexuose
15523 Crust thin polish. hoary, Apothecia somew. inn. : disk flat fleshy-yell. ; border thin somew. inflex. crenat.
15524 Crust tartareous with clustered granules greyish-white, Apothecia scattered : disk plano-convex a little wrinkled flesh-color; the margin inflexed, at length waved
\(\beta\) Crust thin glaucous white running out into papillæ and spiniluferous branches
[becoming black
15525 Crust granul. ciner. Disk of apothecia flat convex yellowish wax-colored ; border elevated inflexed hoary 15526 Crust leprous-tartareous granular powdery dirty-white, Apothecia scattered : disk waxen covered by the powdery inflexed border becoming convex and dilated
15527 Crust granulated bright-yellow, Apothecia crowded: the disk plane of the color as the crust, at length convex deeper colored and powdery; the margin elevated thin, at length waved pulverulent
15528 Crust granular unequal dirty-yellow, Disk of apothecia fat becoming convex somewhat orange-colored; border thin crenulated becoming entire and flexuose
1552y Crust cracked subrugose greenish-yellow, Apothecia at length subglobose deep orange shining when the entire margin becomes obliterated
****** Disk of apothecia red, scarlet, or purple, and sanguine.
15530 Crust submembranaceous smooth, at length unequal pulverul. and granular white, Apothecia crowded : the disk concave red; margin tumid inflexed crenulate
15531 Crust tartareous pulverulent whitish, Apothecia imbedded scattered subconfluent: the disk scarlet rather convex; the margin sometimes obliterated
\(\beta\) Crust tartar. granul. powd. whit. Apothecia sess. : disk flat deep sanguine; bord, elevat. thick rug. persist.

\section*{+1 Thallus adnate, radiate, stellate, and lobed in the circumference. Placodium.}

15532 Crust plaited and wrinkled white: the circumference smooth lobed, Disk of the apothecia at length rather convex brownish-black : the margin thin entire
15533 Crust somewhat imbricated white, Lobes somewhat concave flexuose cut-crenate, Disk of apothecia flat yellowish-brown : border elevated tumid
15534 Crust subimbricated scaly somew. rugose uneven pallid-green radiated and lobed in the circumference : fructification extremely crowded; the disk plane yellowish-brown or subochraceous with a border, at length crenate waved
15535 Crust plaited and lobed cracked bright-yellow orange pulverulent: the circumference plicate and rayed; segm. lin. convex cut, Apothecia crowd. : disk at length convex of a deeper orange ; marg. ent. waved
15536 Crust somew, imbricated plaited and rugose tawny orange naked, Lobes lin. lanc. waved convex somew. distant radiating, Disk of the apothecia concave of the same color with the crust marg. somew. inflex. ent.
15537 Crust somew, contiguous pale yellow with a plaited lobed edge, Lobes flexuose flat, Apothecia scattered, Disk very red plano-convex
15538 Crust cracked greyish plaited and rayed in the circumference lin,-laciniate, Apothecia much crowded at at length angular: disk plane brownish black even with the margin of the crust
15539 Crust cracked pale reddish grey the circumference rayed and lobed having brown warts in the centre cracked and rayed: disk of the apothecia depressed reddish margin thick elevated entire
15540 Crust subimbricat. rugulose whitish lobed and cren. at the circumference : fructification crowd. angular ; the disk plane brownish flesh-color pruinose with a raised and at length crenate flexuose border

HH Thallus imbricated throughout.
15541 Crust with lobed scales of a brownish ash-color: disk of the apothecia immersed nearly plane blackish brown with the margin at length prominent
15542 Crust scaly greenish, Lobes imbricated inciso-crenate waved irregular, Disk of the apothecia slightly swelling brownish orange margin thin entire at length obliterated

and Miscellaneous Particulars.
it grows more abundantly than with us; yet, in the Highland districts, mariy an industrious peasant gets a living by scraping this Lichen with an iron hoop, and sending it to the Glasgew marker When I was in the

neighbourhood of Fort Augustus, in 1807, a person could earn fourteen shillings per week at this work, selling the material at thrce shillings and fourpence the stone of twenty-two pounds. The fructified specimens are reckoned the best.

15543 Crust somewhat scaly greenish ash-colored becoming powdery, Lobes repand cut wavy with irregular margins, Disk of apothecia fat brownish black
15544 Crust scaly yellow, Lobes very much crowded cut and laciniated imbricated their margins minutely granular, Apothecia nearly of the same color as the crust margin elevated entire
\(\beta\) Crust formed of lobes with many crowded teeth and segments greyish yellow, Apothecia crowded waved : disk plane dilated of the same color as the crust at length fulvous and the margin crenulated
15545 Crust scaly greenish-brown, Lobes minute somew, rounded with margin granular and crenulat. Apothecia submerabran. : the disk concave at length dilated plane reddish brown the marg, elevated inflex. crenate
15546 Crust imbricated greyish lobed and granulated ash-colored brown, Apothecia imbedded in the crust crowded irregular: disk rather convex red-brown the margin elevated crenulated persistent
15547 Crust imbricated greyish, Lobes minute appressed blunt, Disk of the apothecia plane black margin elevated and crenate

\section*{\(\dagger\) All the divisions of the thallus equal at end.}

15548 Thallus cartilaginous rigid obicular livid and glaucous smooth bearing dark green scattered tufted excre. scences: tawny beneath and downy, the lobes waved and laciniated angular, Apothecia reddish brown rugose at the margin
15549 Thallus orbicular pale yellowish green rugose at length'granulated black and hispid beneath the lobes waved laciniated round, nearly entire, Apoth. scatter. brown their margin incurv. entire at length pulverulent
15550 Thallus roundish subcoriaceous white smooth finely dotted with black: hispid beneath, Lobes longish sinuate-crenate cut, Apothecia rufous brown
15551 Thallus orbicular greyish white smooth blackish brown and hairy beneath, Lobes rounded cut plane their margin waved entire, Apothecia brown their margin thin entire
15552 Thallus orbicular glaucous green naked with black fibres on the under side, Lobes rounded cut flat somewhat plaited at the edge, Apothecia rufous
15553 Thallus orbicular membranaceous hright green above, beneath pale brown almost white and downy, Lobes waved and cut, the segments rounded subcrenate, Apothecia red, the margin inttex rugose and crenate
15554 Thatlus orbicular membranaceous finely rugose glaucous green, beneath blackish brown fibrous, Lobes cut rounded lax plaited entire
15555 Thallus orbicular olive brown rugged with elevated points paler beneath and fibrous, Lobes radiating appressed plane dilated rounded and crenate, Apothecia dark-brown: the margin crenulated
15556 Thallus orbicular bright yellow : beneath paler and fibrillose; the lobes radiating appressed plane dilated round. crenate and crisped at the extremity, Apoth. of the same colour as the crust theirmargin entire
15557 Thallus orbicular somewhat membranous contiguous plaited umber-olive colored cut crenate in the circumference with flat somewhat truncate lobules
15558 Thallus orbicular cinereous powdery : beneath white with black fibres, Central segments plaited eroded crisp powdery at edge, Apothecia concave blackish brown
15559 Thallus orbicular white hoary granular powdery : beneath of the same color with obsolete blackish fibres, Segments of the circumference flat cut crenate, Apothecia appressed flat brownish black
15560 Thallus orbicular membranous glaucous ash-colored: blackish brown beneath, Lobes sinuate-cut; the end ones rounded crenated, Apothecia brownish with an entire edge
15561 Thallus orbicul. cinereous, Soredia grey margined, beneath brownish spongy and fibrous, Lobes concrete plaited: those of the circumference rounded cut crenate, Apothecia red with a tumid edge
15562 Thallus orbicular yellowish white pulverulent greyish black and downy beneath, Lobes imbricated plane rounded slightly crenated, Apothecia reddish ("of the same color as crust") their margin pulverulent
15563 Thallus orbicul. blueish-grey, beneath having a very thick spongy down, Lobes of circumference rounded 'and crenate, Apothec. scattered at length convex rusty-brown, their margin of same color and entire
15564 Thall, orbic. brownish-grey, ben. having a blueish-grey spongy down, Lobes of circumf. obtusely notched elevated pale, Apothecia plane crowded central reddish-brown with tumid incurv. crenul. whit. margins
1.5565 Thallus orbicular dark purplish-brown shining dotted with black, bencath black and fibrillose : the segments sinuato-multifid linear plane truncated crenate in the circumference, Apothecia dark-brown, the margin slightly crenulate
15566 Thallus orbicul. greyish rough and pitted beneath black and fibrillose : the segments imbricated sinuated plane subretuse, Apothecia bright chesnut-brown, their margin subcrenulated
15567 Thallus orbicular pitchy-brown smooth beneath black and scarcely fibrillose : the segm. sinuated multifid divergent plane or slightly grooved, margins elevat. lacerat. Apothec. dark-brown, margin granulated
15568 Thallus stellated shining pitchy-black, beneath black and almost naked: the segments nearly linear multifid and somewhat palmate convex, the margins and extremity recurved, Apothec, of the same color at length black with the margin crenated
15569 Thallus orbic. tawny-brown paler beneath with blackish fibres: the segment multipartite nearly lin. convex, those of the circumfer. dilated nearly plane and crenate, Apothecia dark-brown, their margin crenated
15570 Thallus stellat. pale-grey, beneath black uneq. naked : the segments often uniting convex and almost round. lin. multifid roughish dotted with black, Apothecia reddish-brown, their margin somewhat crenulated
15571 Thallus stellat. pale-greenish bear. powdery warts, beneath black with spongy fibres: segments of circumference multifid very narrow convex and almost rounded, Apothecia reddish-brown, marg, nearly ent.

and Miscellaneous Particulars.
2341. Parmelia. Named from สaŋนm, a sort of small shield, and \(\varepsilon i \lambda \varepsilon \omega\), to enclose. On the thallus cf these plants scattered powdery warts are commonly found. These Hedwig has determined to be anthers, apparently for no other reason than that they are powdery, and that he could fix the title to nothing better.

History, Use, Propagation, Culture,
2342. Borrera. Dedicated by Acharius, to Mr. William Borrer, F. L. S., one of our most eminent British cryptogamic botanists. This genus is very natural in habit, including the Linnean genus Lichen and its aliies.
2343. Cetraria. An unexplained name. C. islandica is common in Iceland and in the north of Germany, and is also found in the mountains of Asturias. It grows to the height of two or three inches only, and has a rugged bushy aspect. In Iceland and Lapland it is used as an article of diet; being boiled in broth or milk, after being freed from its bitter by repeated maceration in water, or dried and made into bread, It has of late years been brought in considerable quantities to this country for medicinal purposes. The dried plant differs very little from its appearance in a recent state, Medicinally it is tonic and demulcent ; it has also been found useful in debilities after acute diseases, and in emaciations, particularly those arising from the great discharge

15572 Thallus stellat. pale-yellowish grey smooth, black and fibrous beneath : segments broadly lin. sinuato-pinnatifid, their sinuses broad and circular, Apothecia nearly plane dark-brown, their margin thin entire 15573 Thallus orbicular continuous rugose pale-grey pulverulent, beneath of the same color with blackish fibres: segments in the circumference distinct plane rounded waved inciso-crenate, Apothecia plane reddishbrown, their margin at length crenulate and pulverulent
15574 Thallus stellated pale-yellow green smooth bearing powdery warts, beneath brownish-black and fibrillose : the segments linear appressed plane dichotomous somewhat truncated, Apothecia subcentral small nearly plane brown, their margin entire
15575 Thallus orbicul. greenish-yell. smooth with blackish dots, brown and fibrillose beneath : segments sinuatolobate rounded crenate nearly plane, Apothecia central chesnut-brown with the margin nearly entire
15576 Thallus stellated glabrous greenish-white, beneath snowy-white with greyish fibres: the segments imbricated linear plane cut and branched crenate, their extremities ascending and powdery, Apothecia central brown with a tumid singularly rough and crenate border
15577 Thallus stell. smooth greyish-white, beneath black and fibrillose : segm. multif. lin. broader upwards cut divaricated acute in the circumference frequently bearing powdery warts, Apothecia concave chesnut color with the margin entire
15578 Thallus stellated deep glaucous green cæsious and pruinose when dry, beneath black and downy and hispid: the segment linear multifid in the circumference plane appress. waved retuse at the extremities, Apothecia glaucous black, the margin entire and waved at length leafy
15579 Thallus stellat. at length rugged and granulat. greyish-green, beneath with grey fibres : the segm. sublin. rather convex cut multifid, Apothecia glauc, black, their margin entire, at length waved and crenate
15580 Stellate greyish-white and glaucous sorediferous, ash-colored beneath with black fibres: segments linear cut multif. convex but plane at extremities: fructification subconcave black with a subinflexed border
\& Thallus stellate cinereous: segments branched separate recurved at edge roundish, some broader than the rest and powdery at the edge
15581 Orbicular greenish-grey, fibrous and black beneath, Lacinæ imbricated nearly plane multif. erosa-crenate somewhat ciliate: the margin sometimes raised; fructification very dark, the border raised entire
15582 Crust blueish-white tartareous minutely undulated, Apothecia clustered somewhat sunk : disk fat black or brown ; margin thick externally black
15583 Thallus substellated glaucous white : beneath brownish black ; the segm. sinuato-multifid convex glabrous inflated and ascending at the extremity, Apothecia red brown, their margin entire
15584 Thallus substellate greyish-green : beneath rugose blackish and white; segments sinuato-multifid nearly plane smooth bearing powdery warts and perforated; the extrem. inflated, Apoth. redd. : marg. entire

15585 Thallus greyish-white naked on both sides and of the same col, substellat. : segm. pinnatif. ascend. dilat. arched and ciliated at the extremity, Apothecia scattered : disk plane cæsious black; its marg. entire
15586 Thallus palish : segments erect linear multifid attenuated ciliated: beneath very white powdery and channelled, Apothieca with a flat black casious disk
15587 Thallus greenish-grey farinaceous: the segments linear attenuated branched grooved naked rugose and blackish beneath, Apothecia somewhat marginal cup-shaped with their margin thin inflexed
15588 Thallus yellow naked and of the same color on both sides: segments linear flattish pinnatifid branched fibrous at end, Apothecia somewhat terminal with an orange-colored disk
15589 Thallus yellow naked: segments dichotomously branched slightly compressed atten. divaricated complicated, Apothecia scattered: their disk plane orange-red; their margin entire naked
15590 Thallus greenish : segments linear branched attenuated ciliated at end whitish and channelled beneath, Apothecia somewhat terminal : disk concave becoming flat with a fringid border
15591 Thallus pale rufous downy : segm. divaricating tortuous linear tapering channelled on the under surface, Apothecia scattered: disk flattish brownish-black with a thin entire border

15592 Thallus paleyellow very yellow beneath : the segments plane ascending erose crenate and crisped, Apothecia elevated : their disk brown ; the margin crenulated
\(\beta\) Thallus with segm. depressed: the lobes rounded crenate; margins crisped pulverulent and very yellow 15593 Thallus olive-brown paler beneath; the segments plane ascending lobed waved subcrenate, Apothecia elevated of the same color: their margin rugose and crenulate
15594 Thallus glaucous somewhat shining sinuated and lobed brown beneath : the segments cut and jagged curled ascending, A pothecia elevated chesnut-brown: their margin wrinkled
\(\beta\) Thallus white on each side or with occasional black spots beneath

and Miscellaneous Particulars.
of ulcers; and diarrhœeas, dysentery, and hooping cough. Its virtues, however, have been greatly overrated. (Thom. Lond. Disp. 365.)

Though plentiful with us, it is scarcely sufficiently so to form an article of commerce. A great proportion of what comes to our shops, where it is in great request as a medicine in coughs, consumptions, \&c. is procured from Norway or from Iceland. Immense quantities are gathered in the latter country, not only for sale, but for home consumption, as an article of common food. The bitter and purgative quality being extracted by steeping in water, the lichen is dried, reduced to powder, and made into a cake, or boiled and eaten with milk; and eaten with thankfulness, too, by the poor natives, who confess " that a bountiful Providence sends them bread out of the very stones." An ample account of the nutritive qualities of this plant may be found in the Memoir of Professor Proust, inserted in the Journal de Physique, for August, 1806.

History, Use, Propagation, Culture,
2344. Sticta. From simtos, dotted, on account of the numerous little pits on the under surface of the fronds. One of the most handsome genera of Lichens, growing almost wholly upon trees. Sticta pulmonacea is supposed to possess the same qualities as the famous Iceland moss, Cetraria islandica.
2345. Peltidea. So called in allusion to the form of the shields, from \(\pi \in \lambda \tau \eta\), a target. Peltidea aphthosa, a large nandsome species, has its name from the circumstance related by Linnæus, that the Swedish peasantg boil it in milk as a cure for the aphtha, or thrush, in children.
2346. Nephroma. From ve¢еоs, a kidney; the apothecia are of a reniform figure. N. polaris is remarkable for being common to both the arctic and antarctic circles.
2347. Roccella. This is a slight alteration of the Portuguese Roccha, signifying a rock, in allusion to the

15595 Thallus sulphur-colored orange at the base pitted and reticulated erect nearly plane laciniated : its segm. multifid crisped crenato-dentate and often warted at points, Apothecia plane flesh-col. : marg. crenulat.
15596 Thallus olive-brown paler beneath : the segments erect sublinear multifid channelled smooth dentatociliate; fert. branches spreading, Apothecia appressed plane of the same color: margins elevated entire

15597 Thallus dark glaucous brown pitted with broad rounded spreading entire lobes, having bright lemoncolored powdery spots upon the margin and on the elevated parts between the pits: downy and tawny beneath with min. lemon-colored little hollows, Apothecia scattered black.-brown : their margin entire
15598 Thallus glaucous shining very broad woolly beneath, Soredia minute yellow: segments rounded sinuated cut; margin wavy crisp inflexed yellow-powdery
15599 Thallus olivaceous pitted and reticulated downy beneath with smooth prominences: the segm, sinuatolobate truncated, Apothecia submarginal plane reddish: their margin rugose
15600 Thallus suborbicular glaucous greyish-green very broad somew, pitted and having mealy warls: beneath downy tawny with white naked spots; the segments rounded and lobed irregular, Apothecia scattered nearly plane reddish-brown: their margin somewhat crenate
15601 Thallus orbicular glaucous brown roundly lobed smooth grey and powdery at the margin: downy beneath with white hollow spots, Apothecia brown
15602 Thallus orbicular dark lurid-grey rough with brown granules; beneath grey,-brown with white concave spots; the segments roundly lobed nearly entire, Apothecia scattered dark-brown : their marg. entire
15603 Thallus wide rusty brown naked and pitted: brown and downy beneath with small pale excavations; segments lobed and obtusely cut unequal, Apothecia marginal dark-brown

15604 Thallus greenish ash-color white beneath having dark brown prominent branched veins, Lobes rounded cut somewhat entire, Apothecia marginal plane rounded swelling brown scarcely crenulate at the margin
15605 Thallus ash-colored whitish and veiny beneath: the lobes rounded sinuated and cut crenate and crisped; fertile lobules very short, Apothecia orbicular ascending nearly plane brown somewhat entire
15606 Thallus glaucous and brownish green lobed cren, and shining pale ben. with numerous brown branching reticulated veins : fertile lobules abbreviated, Apothecia terminal plane horizontal transversely oblong reddish brown with a nearly entire margin
15607 Thallus green smooth roundly lobed sprinkled with brown warts whitish beneath with brown branching veins: fertile lobules very long contracted in the middle their sides reflexed, Apothecia terminal large ascending red brown with a lacerated margin
15608 Thallus coriaceous concave even dark reddish-brown pale downy with obsolete veins beneath, Lobes rounded with numerous fruit-bearing processes
15609 Thallus greyish green with broad rounded lobes white beneath with brownish branching veins: fertile lobules rather long with their sides reflexed, Apothecia terminal nearly erect revolute reddish-brown with a subcrenulated border
15610 Thallus thin membranous somewhat downy with rounded lobes beneath whitish and netted with veins of the same color, Fertile lobes short, A pothecia minute
15611 Leathery ash-colored and even above: whitish smooth with indistinct pale veins beneath, Apothecia ascending roundish dark reddish brown
15612 Thallus glaucous green naked glabrous with brown reticulated veins beneath : fertile lobules very numerous elongate and as well as the brown terminal, Apothecia cucullato-revolute

15613 Thallus greyish brown pale pubescent and granulated beneath: fertile lobules very short, Apothecia large numerous reddish
15914 Thallus livid brown beneath naked wrinkled blackish, Fertile lobes short, Face of the apotheoia brownish

15615 Thallus rounded glaucous green somew. branched nearly erect, Apothecia scattered elevated: disk flat cæsious pruinose as troad as the border
15616 Thallus fiat cinereous greenish with dichotomous divisions, Segments attenuated, Apothecia marginal

15617 Thallus greenish white segments dichotomous multifid ascending linear-attenuate plane pitted grooved and white beneath, Apothecia bright brown concave
\(\dagger\) Thallus subcrustaceous uniform. Podetia hollow. PYcNothelia.
15618 Subcrustaceous uniform granulated greyish, Podetia ventricose glabrous white simple or branched, the branches very short confluent and subfastigiate, Fructification minute reddish-brown

and Misceltaneous Particulars.
places where this plant is commonly found. This plant is the Orchall or Argol of the dyers, so celebrated for yielding a fine purple color, for which Cudbear is but a poor substitute. Sizreew es def revired frover 2348. Evernia. Eusgyns, signifies tall, or well branched. The name has been well contrived to express the habit of the species, which all form bushy, erect, or pendulous tufts.
2349. Cenomyce. From zevos, empty, and \(\mu v \approx ท s\), a minute fungus, alluding to the hollowness of the little fungus-like receptacles. Cenomyce rangeferina : this is the Lichen which, for the greater part of the year, and especially in winter, is the support of the vast herds of rein-deer, in which consists all the wealth of the Laplanders. No vegetable, Linnæus tells us, grows throughout Lapland in such abundance as this, especially in woods of scattered pines, where, for very many miles together, the surface of the sterile soil is covered with it as with

\footnotetext{
History, U'se, Propagation, Culture,
}
snow. On the destruction of forests by fire, when no other plant will find nutriment, this Lichen springs up and flourishes, and, after a few years, acquires its greatest size. Here the rein-deer are pastured, and whatever may be the depth of snow during the long winters of that climate, thev have the power of penetrating it, and
† Thallus foliaceous. Podetia fistular dilated upwards and fertile, or steriie and subulate. Anothecia closed with a membrane. Scyphorhora.
* Apothecia fuscous or paltid.

15619 Thallus foliaceous very pale glaucous green the segments subpalmated ascending obtuse and incurved, Podetia elongated turbinate all cup-bearing smooth the cups regular crenate with the margin at length leafy and proliferous, Apothecia brown
15620 Thallus foliaceous large glaucous yellow green white beneath the segments multifid waved crenate crisped, Podetia turbinate elongate mostly simple, Apothecia marginal reddish-brown
15621 Thallus foliaceous glaucous green: segments erect multifid narrow repando-subdentate, Podetia cylindrical short glabrous dingy at length black all of them cup-bearing : cups snall regular dilated entire nearly plane proliferous from the centre, Apothecia marginal sessile brownish-black
15622 Thallus foliaceous: segments orenulated ascending, Podetia all turbinate elongate cup-shaped glabrous at length granulat. warty rough grey. green ; cups regular ; the margin at length prolifer. Apoth. browis
15623 Thallus foliaceous : the segments small crenate, Podetia elongate cylindrical cup-bearing sometimes subulate slightly pulverul, white: cups regular their margins ent. and crenat, at length prolifer. Apoth. brown
\(\beta\) Podetia elongated powdery white, Scyphæ radiant at edge
\(\gamma\) Podetia elongate subulate simple or branched pulverulent white sterile or with reddish apothecia
15624 Thallus foliaceous, Segments broadish crenulate cut, Podetia longish smooth somewhat warted glaucous or whitish green, Apothecia irregular torn into rays proliferous at edge
A Thallus foliaceous ash-colored brittle : segments imbricated minute crenate, Podetia cylindrical rough and foliaceous: cups turbinate closed at length dilated and radiated, Apothecia marginal sessile or stalked brownish-black
15625 Thallus foliaceous, Segments smaff crenate, Podetia long subulate sterile and fertile smooth livid-brown, Apothecia cup-shaped toothed at edge occasionally proliferous
\(\beta\) Thallus foliaceous very minute, Podetia elongate subulate sterile and cup-bearing smth. greenish brown: cups toothed at the margin at length proliferous, Apothecia brown
** Apothecia scarlet or deep red.
15626 Thallus foliaceous small : segm, inciso-lobate crenate, Podetia cylindr. simple and somew. branch, at the extremity greenish white granulated rarely cup-bear. ; cups narr. at length radiat. Apoth. minute scarlet
15627 Thallus foliaceous small: segments expanded rounded crenate beneath as well as on the cylindrical yellow green cup-bearing, Podetia pulverulent: cups narrow small at length large with the often branched numerous digitate or rayed prolifications tipped with the bright scarlet apothecia
15623 Thallus foliaceous minute : segments broadish cut crenate naked beneath, Podetia long thick subventricose sulphur-colored slightly pulverulent cup-bearing: cups narrow crenato-dentate at length dilated and jagged, Apothecia sessile and pedunculate scarlet
15629 Thallus foliaceous minute: segm. rounded crenate nak. beneath, Podetia elongated turbinate naked nearly pale yellow or greyish green all cup-bearing, cups with their margins spreading fertile, Apothecia large at length stalked scarlet
\(\beta\) Pode. rather short cup-bearing : cups dilat. crisp.and foliac. term. by the scarlet stalk. Apoth. at leng. prolif. 15630 Thallus foliaceous minute : the segm. inciso-crenate naked beneath, Podetia elongate cylindr. rigid glaior. foliaceo-squamose pale all cup-bear.: cuys narr, their margins fertile and prolifer. Apoth. crowd. scarlet
\(+\dagger\) Thallus foliaceous. Podetia fistular dilated upwards and fertile. Apothecia pervious. Sceasmaria.
15631 Thallus foliac. minute lobed and crenated, Podetia elongated branch, subventr, granulat. rough with leafy scales cup-bearing: cups irregular pervious dentato-radiate proliferous, Apothecia stalked pale brown
\(\dagger \dagger\) Thallus foliaceous. Podetia somewhut fistular, cylindrical, simple, split at end or digitate. Rays all fertile. Helopodia.
15632 Thallus foliaceous with minute granular lobes, Podetia smooth granular pallid divided at end : divisions very short, Apothecia clustered brownish black
\(\dagger \dagger \mid+T h a l l u s\) foliaceous, scarcely any. Podetia cartilaginous, rigid, fistular, all tapering subulate branched. Axille generally bored through. Cladonia.
15633 Podetia elongated smooth at length scaly greenish white inflated curved branched, Branches lax subsecund their extremities divergent spinulose, Apothacia pale brown
15634 Podetia elongated smooth livid brown dichotomous, Axils not perforated, Branches narr. subulate curved the extremities forked divergent : fertile ones with brown apothecia
\(\beta\) Podetia elong. slender sparingly branch. Branches nearly erect: fertile bran. with brown capitate apoth.
15635 Podetia elongate glabr. pale dichotomous: the axils perforated open; extremities of the branches patent short acute and rigid, A.pothecia small terminal brown
15636 Podetia elongate cylindr. erect roughish hoary branched : axils often perforated, Branches scattered very much divided spreading the ultimate ones subradiate or drooping, Apothecia subglobose clustered browra
\(\beta\) Podetia cinereous dichotomously branched rigid forming a cushion-like tuft, Axilla not bored through, End of branches mucronate diverging brownish
\(+1+1+\) Thallus none. Podetia soft, subsolid, subulate, somewhat branched. Axillae not bored through. Cerania. 15637 Podetia subulate nearly simple smooth very white subfistulose flexuose prostrate

and Miscellaneous Particulars.
obtaining their necessary food. Linnæus has given a beautiful description of this Lichen, and of the animals whose support it is, in the Flora Lapponica, p. 332.
C. pyxidata is sometimes cmployed by the poor in the cure of the hooping-cough

History, Use, Propagation, Culture,
2350. Bacomyces. From Raros, smali, and uvzns, a fungus, a name well applied to this genus, which much resembles some minute kinds of Agaricus or Helvella.
2351. Isidium. From \(\sigma \sigma \circ s\), equal, in allusion, we presume, to the small difference which exists in size between the poretia and the substance of the frond.
2352. Stercocaulon. From 5 हegos, hard, and zovioy, a stem, a name well adapted to express the peculiarities of this genus. Its firm branching frond is fitted to occlipying the interstices of crumbling granite, and the cells of volcanic scoriæ. It is the first of its tribe which clothes the lava of volcanoes in a state of decay.
2353. Spharophoron. Front \(\sigma ф \propto s \propto\), a globe, and qega, to bear, in reference to the globular fructification. The most elegant genus of Lichens, at once known by its branched bushy smooth habit, like that of a coralline.

15638 Crust unif. granulat. greenish white, Podetia very short cylindr. Apoth. subglob. wrinkl. pale flesh-color 15639 Crust uniform rugose granulat. and pulverulent greenish white, Podetia very short somewhat compressed, Apothecia fiattish at the top sometimes conglomerate reddish brown
15640 Leaves minute somewhat imbricated rounded nearly entire, Podetia simple tubular smooth
15641 Thallus clustered ascending leafy pinnatif. cut and crisped : bright green above; white beneath, Tubercles from the disk of leaves convex reddish brown

15642 Crust tartareous cracked smoothish nearly even of a brownish cream-color thinner towards the edges, Podetia scattered short hemispherical simple of the same color as the crust, Apothecia brownish
15643 Crust tartareous greyish white, Podetia at length elongat. round. simple or branch. Apeth. brownish-grey 15644 Crust tartarecus thin unequal cracked and greyish, Podetia subglobose at length cylindrical simple and branched, A pothecia dark-brown
15645 Crust cracked areolate warty a little powdery unequal pale sulphur-color, Podetia becoming cylindrical simple and branched, Apothecia yellowish brown
\(\beta\) Crust powdery sulphureous-green, Podetia roundish of the same color, Apothecia pale yellow
15646 Crust somewhat cracked powdery and hoary, Podetia subglobose papilæform very close together, Apothecia brown hoary
15647 Thallus greyish branch. and rough with granulat. excrescences, Branches crowded and very much divided, Apothecia scattered and terminal at length convex conglomerate blackish brown

15648 Thallus palish-brown, Branches lateral elongate lax divaricat. and forked acumi. Apoth. subglobose smeth.
15649 Thallus greyish branched, Branches dichotomous short crowded fastigiate naked rounded rather oltuse, Apothecia globoso-turbinate somewhat warted
15650 Thallis whit branch. Branc. compress. ramulose subfibrill, naked, Apoth. subglob. depress, and smth. above

\section*{HOMOTHALAMI.}

15651 Thallus rounded somewhat shining livid-brown very much branched, Branches filiform compressed at the axils, Apothecia of the same color, at length convex entire at the margin
\(\beta\) Thallus and subsimple branches flexuose or tortuose complicated rather rigid greyish-black decumbent 15652 Thallus roundish angular somewhat pitted dichotomous pale-yellowish: the extremitles much branched lax and slender, Apothecia rather concave livid pruinose, at length flattened
15653 Thallus plane linear laciniated greyish-white glabrous but rugose and pitted subreticulated: the ultimate branches attenuated, Apothecia mostly marginal plane pale flesh-colored
15654 Thallus compressed glabrous pitted branched glauc. white, Branches thickened and fastigiated upwards, Apothecia numerous terminal peltate subsessile white
\(\beta\) Thallus and branches elongated, Branchlets cylindrical attenuated pitted and channelled, Apothecia subterminal appendiculated beneath
15655 Thallus compressed glabrous somewhat pitted branched yellowish-grey, Branches linear attenuated, Apothecia scattered on short stalks of the same color as the thallus
15656 Thallus compressed glabrous somewhat pitted bearing powdery warts rigid branched greyish or greenishwhite, Branches linear attenuated, Apothecia scattered on short stalks plane somew. margin. whitish
15657 Thallus flat somewhat membranous smooth a little pitted white torn, occasionally powdery with dilated flat soredia, Apothecia nearly terminal very large

15658 Thallus deep pitchy-brown rounded or subcompressed smoothish distichously dichotomous, Branches fastigiate black above, Apothecia plano-convex blackish-brown somew. marginated entire and toothed 15659 Thallus glabrous chesnut-brown round. angular pitted and subcompressed naked, Branches and branchl. divaricated flexuose aculeated, A pothecia reddish-brown: the circumference somewhat toothed
\(\beta\) Thallus glabrous chesnut-colored plano-compressed somewhat pitted with the margins denticulate, Branches and branchlets short patent attenuated, Apothecia spinose-radiate reddish-brown
15660 Thallus black rounded capill. suberect branched, Branches fine short. scatter, pat. : extrem. curved grey. 15661 Thallus glabrous pale yellowish-white roundish suberect branched, Branches short attenuated blackish at the points, Apothecia brownish pale in the circumference

and Miscellaneous Particulars.
2354. Alectoria, seems to derive its name from adغx \(\alpha \omega\), unmarried, berause nothing has been made out respecting the male flowers. A. usneoides is a species which grow on trees in warm countries, such as Asia, Africa, and America, hanging down in branches from six to eighteen inches long: it was used by the Arabian physicians as a cordial, and also for the purpose of procuring sleep. A. jubata occasionally supplies the reindeer with food; for which purpose the Laplanders cut down the trees, that the Lichen may be devoured from the topmost branches.
2355. Ramalina. This name does not appear to have any obvious meaning. The species are little bushy tufts generally covered with soredia. They are found in all parts of the world upon trees and rocks; but chiefly upon the former.
2356. Cornicularia. So called in allusion to the multitude of little horn-like divisions into which the thallus is divided. Crustaceous branched tufts, with a solid axis.

2357. Usnea. This word is said to have originated in the Arabic âchneh or âchnên, which is, according to Golius, the name by which the Arabian physicians designate Lichens in general. Crustaceous branched tuft, usually hanging down from the substances on which they grow.

15662 Thallus decumbent rounded smoothish dichotomous greyish-black, Branches and branchl. flexuose intricate forked at the extremity, Apothecia somew. margined plane: circumference naked and granulated 15663 Thallus decumbent rounded roughish black, Branches intricate capillaceous: the ultimate ones simple, Apothecia of the same color entire in the circumference
15664 Minutely shrubby densely tufted erect entangled cylindrical corymbose black with palish notched tips
15665 Thallus nearly erect roughish greenish-grey with very numerous fine horizontal fibres, Branches patent subsimple, Apothecia plane very broad whitish ciliated: the ciliæ radiating long
15666 Thallus pendulous smooth pale, Branches lax much divided subfibrillose: the ultimate ones capillaceous, Apothecia plane broad ciliated, Cilize slender very long
\(\beta\) Thallus nearly erect somewhat shrubby pale greenish-white very much branched subpulverulent and roughish, Branches very much divided flexuose intricate attenuated subfibrillose
15667 Thallus pendulous smonthish rounded thickish pale greenish-grey, Branches divergent here and there fibrillose capillary at their extremity articulated below
\(\beta\) Thallus glabrous greenish-grey glabrous, Branches elongate dichotomously divided articulated, Articulations swelling distinct : ultimate branches capillary fibrillose
+ Thallus crust-like, irregular, or uniform. Placynthium.
15668 Thallus crustaceous roundish brown-black: lobes of the circumference cut crenate; central granular a little branched, Apothecia becoming convex black-edged
\(\dagger\) Thallus imbricated, plaited, roundish, composed of minute lobes, becoming very turgid when wet. Enchycium.
15669 Thallus suborbicular imbricated: lobes thick; all minute rounded crenulated ascending, Apothecia nearly plane aggregated of the same color as the thallus: the margin crenulated subevanescent
15670 Thallus roundish: lobes rounded expanded naked thickened at edge crenate ascending, Apothecia scattered minute concave dull yellow-brown: exterior margin tumid and unequal
15671 Suborbicular : the central lobes somewhat erect glanulated; those of circumference depressed larger obt. crenulate, Fructification scattered rather concave reddish with a granulated margin
15672 Suborbicular imbricated: lobes thickish flat incumbent roundish cut lobed and crenulate, Apothecia scattered immersed in the lobes and concave rufous with an entire edge
15673 Suborbicular imbricated: lobes all thick rounded lobed plaited in circles wavy suberect entire, Apothecia scattered concave whole-colored
15674 Thallus cushion-like formed of thick close blunt complicated lobes, Apothecia somew, marginal roundish whole-colored: disk urceolate with a double edge
15675 Thallus orbicular somewhat stellated imbricated; lobes cut and laciniated; margins elevat. waved crisp. and crenulated, Apothecia marginal nearly plane of same color as thallus : their margin granulated
\(\beta\) Lobes of the thallus deeply laciniated narrow multifid spreading flexuose nearly plane crenate and lobed, Apothecia marginal and scattered dark-brown their margin entire
15676 Thallus suborbicular imbricato-plicate: plaits central erect flexuose, Lobes of the circumference rounded inciso-crenate, Apothecia marginal turbinate fasciculate: disk rather convex reddish
15677 Thallus lobed starry dark green, Apothecium central elevated brownish pink with a paler entire margin 15678 Thallus thick dark-green with elevated intestine-like convolutions
\(\dagger+\) Thallus somewhat foliaceous irregular, formed of naked, expanded, thick, turgid, naked lobes. ScyTinium.
15679 Thallus subfoliaceous green-brown-glaucous: lobes thick close palmate cut; segments somewhat linear round, Apothecia rufous brown
15680 Leafy gelatinous fleshy granulated on both sides of a blackish-olive color, its lobes crowded rounded plaited crisp and cut, Apothecia scattered dark brown
15681 Frond radiating fieshy : segments repeatedly forked fan-shaped crenate convex above concave beneath, Shields prominent at length blackish and flat
\(\dagger \dagger+\) Thallus foliaceous: lobes rounded, downy or fibrous beneath. Mallotium.
15682 Thallus foliaceous blackish-green glaucous and downy beneath, Lobes rounded waved entire, Apothecia scattered elevated plane reddish: their margin entire
15683 Thallus foliaceous somew. imbricated glauc. greenish-brown pubescent and somew. spongy beneath, Lobes rounded sinuated crenulat, and crisped, Apoth. depressed planish brown : their margin foliaceous crisped \(+\dagger+\dagger\) Thallus foliaceous: lobes somewhat membranous, lax, naked, dark-green. Lathagriom.
15684 Thallus foliaceous membranous submono-phyllous orbicular depressed plaited rounded and lobed blackgreen, Apothecia central crowded at length convex reddish brown their margin entire
15685 Thallus foliaceous membranaceous smooth blackish-green : lobes distinct rounded entire lax waved, Apothecia scattered nearly plane reddish: their margin thin entire
15686 Thallus foliaceous membranaceous somew. wrinkled complicate blackish-green granulated on both sides : lobes round, unequal waved and crisp. ent. Apoth. scattered plane dark-brown : their margin entire
15687 Thallus foliaceous membr. imbr. naked black: lobes small roundish cut nearly entire suberect plaited, Apoth. scattered sessile whole-colored with an entire edge
\(\beta\) Lobes sinuate cut crisp toothletted

and Miscellaneous Particulars.
2358. Collema. A Greek word signifying a glutinous substance. All the species are gelatinous, and are supposed by Fries to be Algæ in a Licheniform state. Nostoc cæruleum has been positively stated to be convertible into Collema limosum.

History, Use, Propagation, Culture,
2359. Lepraria. Because the plants upon which these substances grow have the appearance of being diseased with leprosy. urface of the thallus resembling Hebrew or oriental characters upon a pale ground.
\(\dagger \dagger \dagger \dagger+\) Thallus foliaceous: lobes rounded, membranous, thin, naked, cinereous, glaucous, somewhat transparent. Apothecia slightly stalked. Leptocium.
15688 Thallus foliaceous membranaceous thin subdiaphanous lead-color obsoletely rugose and dotted: lobes rounded somewhat cut, Apothecia scattered subpedicellate plane reddish-brown : their margin pale
15689 Thallus nearly erect foliac. membr. subdiaphan, subrugose with obscure reticulations glauc. : lobes smafl subimbr. cut and laciniat. and somew, fringed, Apoth. scattered rather concave red ; their margins pale \(+1++++\) Thallus very finely laciniated and branchletted.
15690 Thallus substellate: the segments very narrow linear appressed very much branched obtuse, Apothecia central nearly plane of the same color as the crust : their margin thin entire
15691 Thallus subimbricated: segm. minute linear multifid unequal granular acute much clustered, Apothecia scattered fleshy rufous margined
15692 Thallus subcæspitose: segm. linear flat irregularly subdivided rugose obtuse; margins repand obsoleteiy crenated, Apothecia scattered of the same color
15693 Thallus pulvinate brown, Branches rounded nearly erect flexuose uneven subfastigiate rather obtuse, Apothecia nearly terminal plane brown margined
15694 Thallus dull-green: segm. aggregate branched granular cylindrical obtuse, Apothecia scattered concave brown : externally spongy and pale with an erect thin margin

\section*{ATHALAMI.}

15695 Crust thick pulvin. bright sulphur-color composed of a dust-like substance collect. into somew. hairy glob. 15696 Crust spreading equal thin somewhat cracked bright-yellow composed of subglobose granules 15697 Crust not discernible, Fructification of an ochrey-yellow collected into thin scattered patches 15698 Crustac. granulated continuous somewhat gelatin. : greyish dull-green when dry; bright-green when wet

\section*{PSEUDO-LICHENES.}
+ Disk of apothecia very narrow, crack-like, somewhat covered in by the conniving tumid margins. Hysterina.
15699 Crust somew. cracked unequal very white, Apothecia clustered minute oval-oblong turgid : disk closed
15700 Crust tartareous determined reddish-white, Clefts immersed convex without any elevated border repeatedly branched curved parallel and equidistant
15701 Crust tartareous smoothish cohering uneven whitish, Apothecia innate oblong: disk resembling a cleft, at length rugose waved plaited dissimilar rather confluent with the disk irregular somewhat dehiscent
\(\beta\) Crust tartareous or leprose uneven pulverulent, Apothecia roundish dissimilar waved plaited tortuose and variously expanded in the disk
15702 Crust tartareous powdery very white, Apothecia longish straight swelling opaque collected in a stellate manner : disk like a crack
15703 Crust very thin brownish-black, Apothecia minute much crowded roundish elliptical, at length rugose irregular: disk very narrow
15704 Crust somewhat membranous very finely cracked rugose roughish cinereous-brown, Apothecia minute innate clustered convex elliptical oblong straight with a crack-like disk
\(\beta\) Crust membranous smoothish pale-olive or green and rufous-brown, Apothecia variable roundish oblong straight and curved
15705 Crust between cartilaginous and membranaceous somewhat scaly smoothish greyish-white, Apothecia sessile long or roundish waved somewhat shining with the disk very narrow
15706 Crust very thin of a regular figure polished cinereous, Apothecia innate minute convex rugulose opaque various: smaller dot-like; longer very slender flexuose somewhat branched
\(\beta\) Crust very thin shin. pale-olive, Apothecia subellipt, simp. somew. parallel becoming stellate and angular 15707 Crust membranous polished somewhat bordered whitish, Apethecia sessile various: the smaller globose or oblong; larger very long narrow roundish flexuose
\(\beta\) Crust regular membranous whitish, Apothecia sessile close together somewhat shining longish flexuose simple and branched: disk somewhat channelled
\(+\dagger\) Disk of apothecia concave, channelled, or flat, appcaring between the separated margins. Alyxoria.
15708 Crust cartilagi:c. lep. white, Apothecia scatter. sess. round and oval deform. : disk flat becoming coivex
\(\beta\) Crust cartilaginous membranous dirty-white ash-color, Apothecia variable sessite oblong and tapering at each end opaque : disk flat
\(\dagger \dagger\) Thallus cartilaginous, membranous, contiguous, polished. Liccphlea.
15709 Crust very thin smooth much cracked very black, Apothecia very minute subglobose immersed : the extremity prominent umbilicated; nucleus blackish

2361. Verrucaric. Thus called, from verruca, a wart, on account of the verrucose nature of the shields. Schrader says, this genus differs from the similar Eudocarpon in having the shields always closed, while the latter explodes its contents by a small but distinct orifice.

History, Use, Propagation, Culiure,
2362. Porina. From swgivos, any thing that crumbles away, a name applied in consequence of the nature of the crust of these plants, which, indeed, is common to them with other Lichens.
2363. Arthonia. A name, the meaning of which is unexplained. The species are similar in habit to Spiloma and Opegrapha.

15710 Crust very thin determined polished brown. Apothecia min. hemisph. glob. without orlflces: kernel white 15711 Crust membranous determined shining somewhat olive-colored, Apothecia subsessile scattered hemispherical conoid papillose: kernel compressed somewhat membranous white
15712 Crust exceedingly thin spreading quite white, Fructification minute roundish subelliptical, Tubercles semi-immersed: the interor white
15713 Crust thin cartilaginous membranous polished becoming cracked whitish, Apothecia minute hemispherical clustered subconfluent with scarcely any orifice
† Thallus nearly solid, somewhat gelatinous. Blennorina.
15714 Crust somewhat gelatinous roundish broken dark crenate cut radiated in the circumference, Apothecia subglobose immersed papillose at end
\(+\dagger\) Thallus subtartareous, crustaceous, contiguous, cracked into areola, or powdery. Lithocia.
15715 Crust tartar. contig. whitish, Apothecia minute clustered immersed subglobose dirty transparent inside
15716 Crust tartareous contiguous bordered finely dotted mouse-color, Apothecia minute subglobose immersed with a prominent papilla: dirty-white inside
15717 Crust tartareous contiguous finely cracked subrugose lead-color, Apothecia subglobose innate finely becoming depressed and scutelliform
15718 Crust with the figure of a tree greenish-black bordered, Areolæ nearly separate somewhat branched radiating, A pothecia conoid becoming concave above
B Areolæ of the crust dispersed deformed brownish-black
\(\dagger+\dagger\) Thallus soft, cottony, somewhat spongy, or thin and arachnoid. Inoderma.
15719 Thallus thin somew. fibrous uneq. pale-yell. Apothecia minute globose immersed with a prominent orifice
15720 Crust equal polished whitish ash-colored, Warts of apothecia subglobose, Orifices several depressed black

15721 Crust white powdery and crackeu, Tubercles numerous depressed oblong irregular obtuse yellowishbrown clothed with deciduous mealiness
15722 Crust cartilagin. membr. white, Apoth. sess. broad. tum. round. rep. irreg. and conf, dark with elevat.dots 15723 Crust membr, pale cinereous and glaucescent, Apoth. flatten, upon the crust plane angular substell, black 15724 Crust membr. somew, olive-col. Apoth. min. flat concav. somew. membr, oval-ellipt, and renif. wrink. dark 15725 Crust thin subtartareous equal somewhat cracked white, Apoth. clustered flat somewhat immersed round oblong and curved black cæsious
\(15 \% 26\) Crust membranac. smooth somew, shining white or greyish-brown bordered with black, Apothecia half immersed naked \&lexu. simple or branch, : disk very narr. marg, formed of the thallus raised membranac.
3 Crust effuse membr. whitish, Apoth. emerging flexuose with a channelled dehiscent casious disk with an elevated tumid margin
\(\gamma\) Crust very thin hoary glaucous shining, Apothecia emerging straight long nearly simple acuminate somewhat parallel: disk channelled
15727 Crust somewhat cartilaginous unequal very white, Apothecia immersed flexuose branched black: branches divergent forked acute, Disk broad flat naked
15728 Crust cartilaginous membranous unequal rugulose of a regular figure white and cinereous, Apothecia immersed long clustered flexuose nearly simple and branched
15799 Crust membranous polished pale-olive, Apothecia clustered nearly simple curved turgid obtuse: disk broad convex cinereous pruinose with a thick powdery white margin
15730 Crust orbicular granular smooth white, Apothecia immersed scattered short straight nearly simple : margin of the perithecium with a longitudinal furrow

and Miscellaneous Particulars.
23f4. Graphas. From youpw, to write. The apothecia are extremely similar in form to the characters of some strange language. It is very near Opegrapha from which it does not at all differ in habit.

Reproductive organs uniform. Sporules (e) arranged in tubular cells (f) placed in some parts of the external surface. Substunce various (g), mostly thich and fleshy, sometimes vesicular. Frond none
IN speaking of the eighth order, Lichens, it has been observed, that they, Algæ and Fungi, might be considered collateral. But perhaps Fungi should be estimated as still lower in the scale of creation than Lichens. From some passages in the writings of a celebrated Swedish author upon Fungi, Mr. Fries, whose mode of arrangement is almost entirely adopted here, it would seem as if he considered the three orders to consist of the same beings altered by the material on which they grow, and organized according to the different elements upon which they depend for support. Algæ, he observes, which are much extended in their native element, water, when exposed to the air, contract and become Lichens. Thus Nostoc muscorum becomes Collema limosum, \&c. ; and Sir James Smith has even decided, that Lichina pygmæa when growing under water is an Alga, and when above water a Lichen. But the differences between Fungi and Algæ, or Lichens, are greater, and arise out of their essence; that of Fungi being always reproductive, of Algæ primitive. In Algæ, the thallus is the most essential part, and the reproductive organs of secondary importance; in Fungi, the whole plant is generally a mass of reproductive matter, and the thallus always accidental. Fungi always grow upon dead vegetable matter; Lichens always upon living vegetation. The bark which, when living, bears Lichens, produces Fungi as soon as it begins to decay : and even on the same half-dead branch, the living side will be found occupied by Lichens, and the dead by minute Fungi. The lowest Fungi are considered by Fries, to bear the same relation to plants as Entozoa to animals; for which reason, he is of opinion, that all infusorial plants are Fungi, and not Algæ. But this may be doulted. The number of Fungi which may be conceived to exist s incalculable. Multitudes have been discovered by the researches of modern observers, and multitudes still remain to be detected, especially in extra-European countries. In Sweden, in the small space of a square furlong, where the number of Phænogamous plants was 420 , and of Lichens and Algæ 430, Fries discovered more than 2000 species of Fungi.

The most celebrated writers on Fungi are Micheli, Schæffer, Bulliard, Bolton, Sowerby, and Greville, for figures ; and Persoon, Link, Nees von Esenbeck, Fries, and Greville, as systematists.

Link defines the essence of a Fungus to be sporules disposed in a series, in elongated tubular cells; the cells situated in some part of the external surface. The part in which the reproductive organs are placed is called the hymenium ( \(a\) ), the hollow base from which the stem or stipes (a) arises is named the volva (b) or urapper"; the upper part is the cap or pileus (c), which is provided on the inferior surface with thin radiating expansions, which are termed gills or lamella, among which the sporules are situated. Many Agarics have a delicate fringe connecting the margin of the pileus at a certain age with the stem; this is called the veil \((d)\), and is either general (universale), when adnate with the surface of the pileus, but becoming obsolete with age; or it is partial when it extends only from the margin of the pileus to the stipes. The annuulus ( \(d\) ) is a kind of veil, which is sometimes fixed to the stem, at others free and capable of being moved upwards and downwards. The Peridium, Perithecium, or Perisporium, are different names for the envelope immediately enwrapping the sporules.

\section*{Tribe I. HYMENOMYCETES.}

Hymenium nalied.
Class I. Hymenini v. Agaricinie.
Hymenium distinct. Receptacle long or expanded, superior.

\section*{Division I. Pileati.}

Receptacle dilated, occasionnlly branched, having tendency to an orbicular form. Hymenium inferios: Asci fixed.
2365. Agaricus Hymenium in lamellæ. Lawellæ simple, parallel.
* Stem central, with a veil. Gills unchangeable. Sporidia white.

8 1. Amanita. Veil double, universal separate, partial annular somewhat persistent.
82. Lepiota. Veil simple, universal, concrete, annular, somewhat persistent.

\section*{Observations.}

Tribe I. Hymenomycetes. This tribe is readily distinguished from the others by its hymenium containing sporules within the surface, and not naked; from the Pyrenomycetes by the want of a perithecium and a reproductive nucleus; from Gasteromycetes by the want of a peridium inclosing the sporules, which constitute the mass of the fungus, and from the Hyphomycetes and Conionycetes by the sporidia not being exposed.

Division I. Pileati. This constitutes the most extensive division in Fungi, and includes almost every thing which was known to the ancients. Dioscorides mentions one or two species distinctly, comprehending the remainder among his eatable and unwholesome kinds. Pliny talks of the very numerous kinds of fungi, but describes very few. C. Bauhin knew about sixty, which he chiefly obtained from Clusius; Tournefort had two genera and eighty-seven species; Micheli six genera and about 800 species; Linnæus three genera and fifty species; Persoon, in his Synopsis, mentions nine genera and 683 species; finally, Fries describes more than a 1000 species arranged under many genera and subgenera.

The species are widely scattered over all Europe, but the extra European fungi, with the exception of thosc
8. Armillaria. Veil simple, partial, separate, annular, somewhat persistent.
84. Limacium. Veil very fugacious, viscid. Lamellæ adnate, decurrent.
§ 5. Tricholoma. Veil very fugacious, flocculose, marginal. Lamellæ emarginate or rounded.
** Stem central, naked. Gills unchangeable. Sporidia white.
§ 6. Russula. Pileus fleshy, becoming depressed. Lamellæ equal, juiceless.
7. Galorhous. Pileus fleshy, becoming depressed. Lamellæ unequal, milky.
8. Clitocybe. Pileus fleshy, when young convex. Lamellæ unequal, juiceless.
9. Collybia. Pileus fleshy-membranous, flattish. Small, dry.

8 10. Mycena. Pileus membranous, campanulate. Slender. Stipes hollow.
6 11. Omphalia. Pileus membranous or fleshy-membranous, when young umbilicated.
*** Stem out of the centre, none. Gills unchangeable. Sporidia white.
§ 12. Pleurotus. Pileus out of the centre or lateral.
**** Stem always central. Veil O. Gills changing color. Sporidia rose-coloved.
13. Mouceron. Pileus fleshy, becoming depressed. Lamellæ long, decurrent. Odor of new flour.
14. Clitopilus. Pileus fieshy, convex.
15. Leptonia. Pileus fleshy, membranous, from convex becoming plane. Small.
16. Nolanea. Pileus membranous, campanulate. Slender. Stipes hollow.
17. Eccilia. Pileus umbilicate. Lamelle adnate.
17. Eccilia. Pileus umbilicate. Lamelle adnate.
***** Stem always central. Veil like cobweb. Gills changing color, becoming dry. Sporidia ochre-colorcd.
8 18. Telamonia. Veil annular, woven, somewhat persistent. Lameliæ distant.
19. Inoloma. Veil fugacious. Lamellæ emarginate. Stipes bulbous. Color something of violet.
§ 20. Dermocybe. Veil fugacious. Lamellæ closely packed. Stipes equal.
****** Veil distinct, not like a cobweb. Gills discolored, somewhat persistent. Sporidia ferruginous.
§ 21. Pholiota. Veil dry, annular.
22. Myxacium. Veil viscid, fugacious. Lamellæ affixed.
§ 23. Hebeloma. Veil marginal, fugacious. Lamellæ emarginate.
******* Veil very fugacious or spurious, not like a cobueb. Gills discolored, somewhat persistent. Sporidia ferruginous.
8 24. Flammula. Pileus fleshy, convex, smooth, somewhat viscid. Lamelle not emarginate.
25. Inocybe. Veil formed of the longitudinal fibres of the fleshy convex pileus. Lamellee whitish.
26. Naucoria. Pileus fleshy, membranous, flattish, squamulose. Smail. Lamella cinnamon-colored 27. Galera. Pileus membranous, campanulate. Slender. Stipes hollow.
28. Tapinea. Pileus umbilicate, villous at edge.
29. Crepidotus. Pileus out of the centre or sessile.
******** Veil present, not unlike a cobweb. Gills becoming discolored, cloudy, dissolving. Sporidia brownish-purple.
\$ 30. Volvaria. Veil universal, separate. A volva.
31. Psalliota. Veil annular.
32. Hypholoma. Veil marginal, fugacious. Lamellæ emarginate. Stipes bulbous.
33. Psilooybe. Veil very fugacious. Pileus somewhat fleshy, and stipes equal, tenacious.
34. Psatyra. Pileus somewhat membranous, and stipes brittle.
35. Coprinarius. Lamellæ with a tendency to deliquesce. Veil partial. Sporidia blach.
2366. Coprinus. Hymenium in lamellæ, which finally become deliquescent. Asci separate with sporidia in four rows.
2367. Gomphus. Hymenium in lamellæ, which are long branched and decurrent. Pileus turbinate, umbonate.
2368. Cantharellus. Hymenium veined, Veins dichotomous, subparallel, sometimes anastomosing,
2369. Merulius. Hymenium veined. Veins flexuose, or forming very irregular pores. Plants sessile, resupinate or effused.
2370. Schizophyllum. Hymenium in lamellæ, Lamellæ bifid, lengthwise revolute.
2371. Dadalea. Hymenium sinuous, composed of anastomosing lamellæ or flexuose elongated pores.
2372. Polyporus. Hymenium porous, not separable from the substance of the pileus nor the pores from each other. Pores sometimes lacerating in age. Pileus very rarely with a central stipes.
\$1. Favolus. Pores ample, with four or six angles resembling an honeycomb.
2. Microporus. Pores minute, roundish.
8. Polysticta. Dots superficial only.
2373. Boletus. Hymenium tubular. Tubes separable from the pileus and from each other. Pileus always with a central stipes.
2374. Fistulina. Hymenium tubular. Tubes loose, the young ones closed.
2375. Hydnum. Hymenium subulate. Subulæ loose.
2376. Sistotremar. Pileus carnose, irregularly stipitate. Hymenium composed of dentate, interruptec lamellæ.
2377. Phlebia. Hymenium rugose, formed of long or confluent papillæ.
2378. Thelephora. Plant with very few exceptions more or less adnate, thin, coriaceous, very rarely infundibuliform. Hymeniun covering the outer surface.
2. Phylacteria. Sporidia four in a row. Resupinate and growing on the earth.
3. Himantia. Effuse resupinate, when young byssoid, Sporidia few, innate in the lymenium, which is smooth and naked in the middle.
4. Leiostroma. Resupinate, somewhat contigrous, smooth, or with spuricus papillæ. Asci none.

\section*{Observations.}
on the coasts of Barbary, and a few from North America, are almost universally distinct from the European kinds. They are found growing on the earth, or in decayed wood, or similar substances; never upon rocks, Those which have been described as natives of vaults and places underground, are believed to be mere monstrous formations. They are in greatest perfection in warm rainy weather, being chiefly the creations of summer and autumn; a few only appear in the spring, and scarcely any in the winter. The duration of the pileate fungi is often only ephemeral; some last from a week to a fortnight; and a few for a longer time. The Dædaleæ and Polypori are often called perennial, but it is the opinion of Fries, that their substance decays, and is only covered yearly by a fresh layer of pores. The roots of many of those which grow upon trees is perennial ; of others merely annual.

When crude they are mostly poisonous, with a mucilaginous taste, which is often acrid, but they become less dangerous by cooking. The dangerous qualities of some of the kinds is attributable to the larva with which they are infested.

Division II. Clavati.
Receptacle long, simple, or branched, with a tendency to a cylindrical form, not margined. Hymenium superior. Asci fixed.

\section*{* Hymeniam occupying the whole surface. Asci distinct. No distinct stem.}
2379. Clavaria. Plant carnose, cylindrical, simple or branched. Hymenium smooth, occupying almost the whole surface, confluent with the stipes
2380. Calocera, Plant branched or simple, cylindrical, homogeneous, corneous, gelatinous, viscid, Growing on wood.
** Hymenium only occupying the end. Asci long. Head separate from stem, simple.
2381. Geoglossum. Hymenium short, club-shaped, mostly compressed, stipitate. Stipes elongated, smooth or hairy. Plants black or dull green.
2382. Spatularia. Hymenium club-shaped, separate, compressed, running down the stipes on each side, bearing the asci at the upper end.
2383. Mitrula. Hymenium clavate, ovate, closely surrounding at the base the stipes, which is distinet.
*** Hymenium only occupying the end. Asci obsolete. Head separate from stem.
2384. Typhula, Hymenium thin, subcylindrical, persistent, terminating the capillary stipes.
**** Hymenium covering the whole surface, but bearing sporules at the end only, without asci.
2385. Pistillaria. Simple, contiguous, linear or clavate. Sporidia emerging at end,

\section*{Class II. Uterini v. Elvellacee.}

\section*{Hymenium distinct, superior, margined. Receptacle urceolate or reflexed, always inferior.}

Division 1, Mitrati.
Receptacle pileiform, bullate, never closed. Hymenium neither margined nor discoid.
2386. Morchella. Pileus lacunose, confluent with the stipes either at the margin or a little above it. Hymenium occupying the whole outer surface.

2:347. Helvella. Pileus submembranaceous, irregular, smooth on each surface, deflexed at the sides. Hymenium occupying the whole outer surface.
2388. Verpa. Pileus conical-deflexed, equal. Hymenium smooth or rugose.
2384. Leotia. Pileus ovate-conical or orbicular, wholly occupied by the hymenium, the margin free, but ctosely embracing the stipes.

\section*{Division II. Cupulati.}

\section*{Receptacle cupulate, equal. Hymenium discoid, when young somewhat closed, surrounded by the margin of the receptacle.}
2390. Pexiza. Pileus mostly carnose, sessile or stipitate, more or less cup-shaped at length sometimes plane. Hymenium occupying the disk.
§ 1. Aleuria. Fleshy, or fleshy-membranous, pruinose or scurfy with flocculent matter, Usually on carth.
§ 2. Lachnea. Waxy, hairy or villous externally. Usually on wood.
6. Phialec. Waxy or membranous, rarely gelatinous, smooth, naked. On wood.
64. Helotium. Plano-convex. On wood.
2391. Ascobolus. Pileus carnose, cup-shaped or hemispherical. Sporuliferous cells in the disk, forming prominent points filled with a fluid intermixed with the eight sporules.

\section*{Observations.}

Division II. Clavati. Scarcely any traces of these fungi can be discovered in the writings of the ancients. Clusius described a few. Tournefort confounded them with corals and Lycoperdons. Holmskiold and Persoon are the principal modern writers upon this tribe.

Almost all the species of which there is any certain knowledge are European. The genuine kinds are terres. trial ; those which are found upon wood, being transitious to other orders. In vaults or caverns they become umusually developed, and the asci, on account of the excessive supply of moisture, expand and become flocculent. Most are found in the autumn ; the branched kinds are often what are termed meteoric, that is to say, spring up suddenly after heavy falls of rain. They seldom last more than fourteen days.

In qualities they are mild, some having a bitter taste, but the greatest number are almost entirely destitute of smell, color, or taste. Many of the large kinds are used in cookery, and are eaten by various herbivorous animals.

Class II. Uterini. The natural form of the receptacle is cupulate, but in the most perfect kinds, the cupula is reflexed, and is called a mitra; in the least perfect, which are innate in the matrix, the receptacle is almost wholly obliterated. The resupinate Pileati are distinguished from these by their immarginate form, and by their asci.

Division I. Mitrati. A small division, apparently wholly unknown to the ancients. The species are alnost entirely European; a few are found in North America and Siberia. It is probable, however, from the evidence of Loureiro and others, that some peculiar genera and species exist within the tropics. They are generally fond of a humid shady station. None are found in subterraneous places. If an individual is occasionally produced upon wood, it is upon such as is wholly decayed. Many spring up in the autumn and spring; they are rarely meteoric, but some appear in greater abundance in one kind of season than in another. Most of them last for a fortnight, and retain their form when dry

Their qualities are generally mild, nutritive, and juiceless; one is said to be bitter. They are little infested by larvæ. Several are used as food.

Division 11. Cupulati. These are included in the Fungoides of the old botanists. The species which are separate from their thallus and much developed, are little changed by the places in which they grow, and are therefore the same in the most remote countries; but the eruptive or innate species, which are more affected by the nature of the substance by which they are fed, are liable to greater changes when their matrix is altered. For it is a general rule, that the more a fungus is innate in the substance which produces it, the more it is not only imperfect, but affected by its situation, and vice-versâ. Hence Cæoma, which is of a very low order, consists of as many species as the plants upon which it grows, just as a vowel forms as many distinct words as it is combined with distinct consonants.

The Clavati and Pileati, which chiefly depend upon the access of light, are in perfection from spring to autumn; the Elvellaceæ from autumn to spring. The Cupulati also depend much upon the operation of light, for in caverns or cellars they remain closed and sphxria-like. Such is the case with Peziza cerina, which in dark places, undergoes many metamorphoses; and Cenangium under similar circumstances, when some obstacle is offered to the developement of its hymenium, becomes deliquescent. Generally the terrestrial sorts agree in habitude with the preceding divisions; but those which are eruptive are often in perfection for half a year together.
Class III. Tremellini. These are nearly akin to the Pileati and Clavati, especially to Thelephora and Calocera; and also to Elvellaceæ, more particularly to Hygromitra, Peziza, Mollisia, Bulgaria, and Ditiola, but they are distinguished without difficulty by the characters assigned to them.

Formerly all the genera were confounded under onc, along with various species of Lichens and Alga. These
2392. Bulgaría. Cupula closed at first. Asci immersed, with paraphyses, becoming separate and bursting out. Gelatinous.
2393. Ditiola. Hymenium becoming plaited and deliquescent. Cupula open. Veil universal. Corhy.
2394. Cenangium. Hymenium smooth, persistent, rarely deliquescent. Cupula closed, but opening finally. Somewhat coriaceous.
2395. Stictis. Hymenium smooth, immersed. Cupula obliterated. Hymenium persistent.
2396. Cryptomyces. Spreading, quite adnate, emerging, nearly plane, carnose. Hymenium covering the whole surtace. Theca erect. Sporidia large, oval.

\section*{Class III. Tremelling.}

Hymenium confounded with a gelatinous receptacle. Sporidia separate. Asci none.
2397. Tremella. Receptacle gelatinous homogeneous, fructifying in all directions, without papillæ. Sporidia nearly emerging.
1. Coryne. Fleshy gelatinous, somewhat clavate.
2. Phyllopta. Somewhat cartilaginous, expanded, leafy.
2398. Exidia. Receptacle gelatinous, homogeneous, covered on the upper surface only by a papillose hymenium. Sporidia emitted with elasticity.
2399. Dacrymyces. Receptacle gelatinous, homogeneous, filled with assurgent flocci, and sporidia placed in layers inside. When young compact, but finally deliquescent.
2400. Agyrium. Receptacle spherical, smooth, compact, waxy, when humid gelatinous, finally crumbling away in sporidia.
2401. Hymenella. Recep acle flattened, adnate, smooth, like soft leather, very thin, persistent.
2402. Ncematelia. Receptacle gelatinous, surrounding a compact heterogeneous nucleus. Sporidia emerging.

\section*{Class IV. Scerbotiacee}

Hymenium confounded both with the fleshy receptacle and the sporidia. Asci none.
2403. Acrospermum. Elongated, somewhat clavate, with a coat of a similar sulistance, distinctly fructifying at the end,
2404. Sclerotium. Subglobose, or without regular form within, homogeneous, vesiculose, carnose, or corneous, Sporules unknown.
2405. Rhizoctonia. Deformed, united with a similar persistent coat by means of root-like fibres proceeding from all points of its surface.
2406. Periola. Rootless, fleshy, covered entirely by a villous persistent coat.
2407. Acinula. Routless, smooth, with a distinct farinaceous granular coat.
2408. Erysiphe. Sporangium epiphyllous, very minute, globose, furnished with white radiating subjacent filaments, and containing sporuliferous bodies.

\section*{Tribe II. GASTEROMYCETES,}

Furgus entirely closed, and bearing sporidia in the centre; and so forming an ufcrus.
Class 1. Angiugastres.
Uterus finally bursting forth, separate from the receptacle. Sporidia lodged in the receptaclc.
Division I. Phalloidece.
Receptacle separate, open on account of the bursting of the uterus. Sporidia placed in a mucous layer.
2409. Phallus. Stipes issuing from a volva. Pileus furnished with large cells filled with a sporuliferous slimy substance.

\section*{Observations.}
are by modern writers now referred to their proper stations. The genus Mycoderma of Persoon, to which are referred those tough skin-like coatings which are found upon vegetable extracts enclosed in bottles, and which is generally placed among Tremellini, is thought by Fries to bo not of a vegetable nature.
The species at present known are found in Europe, Asia, and North America, but no material difference seems to becaused in them by their native country. All the species, with one exception, are epiphytes; the most perfect bursting forth from the bark of trees; the least perfect occurring on decorticated wood, the stems of herbs, \&c. \&c. The more the wood is dried, the nearer the species approach to Lichens; the more it is humid to Algæ. They are in perfection in the latter part of autumn, winter, and early spring, but scarcely any are found in the summer. Some live for a month or more; others appear to be perennial. When dry they are not to be recognized; they may nevertheless be preserved, and if moistened, they recover their original appearance. It must be observed, that they are in all cases to be examined in a wet and tumid state.

Their qualities are refrigerant, and but little known. They are destitute of smell and taste, for which reason, and on account of their mucilaginous texture, scarcely any species is eatable. Many of the large kinds were formerly used in medicine in cases of ophthalmia, under the name of the "Jew's ear." Vinegar in which they had been stceped was also used as a gargle in tumors of the throat, according to Clusius. Tremella fimbriata is said to furnish a dye, and the sporidia of T. mesenterica to dye ycllow. Dacrymyces destroys timber.
Class IV. Sclerotiacea. The affinity of this class is complex; for the lower we descend, the less differences are to be found between natural bodies. Thus Sclerotiacei are not only closely connected with the preceding divisions, but have a more or less obvious relation to all the hymenine and epiphytous classes of other tribes.
Before the time of Tode, a most sagacious observer, who was the first to distinguish the Sclerotia from other fungi, a very few species only were known, which were confounded with Lycoperdon, Sphæria, Tuber, and other genera. He was followed by various other mycologists, and especially by Decandolle, who described thirtynine species. Tode, Persoon, and Link, have been unable to detect any fructification; Decandolle, Ehrenberg, and Fries, declare that the sporidia are scattered through the whole mass of the fungus, and emerge from it like hoar-frost.
Most of the known species are epiphytes, either upon living or recently dead plants. When growing in cellars and subterraneous places they undergo no alteration, but they do not fructify. They flourish most in the winter, late in the autumn, and early in the spring; and are exceedingly common just at the retreat of winter. A very few Spermodia only are found in the summer. Their odor and smell are either inconspicuous or nauseous. None of the species at least are eatable. Those which grow on rotten seeds are exceedingly poisonous. Some feed on the roots of living plants, which they destroy ; others infest sickly herbs, whence they are a pest to the farmers.
Tribe II. Gasteromycetes. These fungi consist of concrete cells; they have a determinate figure and a tendency to a spherical form; at first they are closed, but finally are furnished with an orifice; or burst in an irregular marner, and emit an internal mass of reproductive matter, which either crumbles to pieces or deliquesces. The integument is of various natures, either a volva, a peridium, or perithecium, of a somewhat bladdery texture; and is simple or double, but rarely multiple. They almost all, when young, are fluxile or soft, or have some part or another of a fluid nature ; afterwards they become indurated and rigid, and assume their true forms.
Class I. Angiogastres. These are fungi of remarkable forms, and most unusual mode of fructifying; they were well known to Clusius, not to mention the celebrated Truffle of which Theophrastus had knowledge. They are found in different climates; but the most perfect only in temperate regions. The latter are also
2410. Batarrea. Head hemispherical, crumbling to pieces under the vertex into a little tuft of hairs bearing sporules. Stipes smooth. Involucrum triple, flowing with mucilage.

\section*{Division II. Tuberacece.}

Sporangia membranous, scattered in an hymenium which is often grated with veans, and inclosed in the uterus.
Sporidia pulpy at first.
2411. Tuber. Uterus closed, marbled with veins inside. Sporangia stalked, scattered among the veins. Subterianeous.
2412. Rhizopogon. Uterus sessile, bursting with irregularity, with anastomozing veins inside. Sporangia sessile. Above ground.

Division III. Nidulariacea.
Uterus filled with separate sporangia.
2413. Nidularic. Common peridium simple. Sporangia lenticular, fleshy, with sporidia in heaps in the middle,
2414. Myriococcum. Peridium simple, flocculent-furfuraceous, disappearing. Sporangia globose, with sporidia in round heaps.
2415. Polyangium. Peridium simple, membranous. Sporangia oblong, filled with a grumous mass,

Division IV. Carpoboli.
Uterus protruding a solitary separate sporangium.
2416. Atractobolus. Peridium cupulæform, with a lid. Sporangium fusiform, with mucous sporidia.
2417. Thelebolus. Peridium sessile, urceolate-ventricose with an entire orifice. Sporangium papillæform, with mucous sporidia.
2418. Pilobolus. Stipes or receptacie pellucid, watery. Peridium a roundish vesicle, bursting elastically, placed on the apex of the receptacle.
2419. Spharobolus. Peridium double, both stellate; the inner membranous by inversion throwing out with elasticity a globose sporangium, bearing in the middle heaped sporidia.

Class II. Prrenomycetes.
Uterus genuine, forming the receptacle. Sporidia disposed in asci in regular rows.
Division I. Sphariacei.

\section*{Perithecium closed, perforated by an orifice, filled by an ascigerous somewhat deliquescent nucleus.}
2420. Xylaria. Receptacles stipitate, carnose or suberose. Spherules immersed in the receptacle, and containing a gelatinous sporuliferous mass.
2421. Stromatospharia. Receptacle sessile, free, or bursting from beneath the bark of dead wood. Spherules immersed.
2422. Cucurbitaria. Spherules tufted, free, fixed on a receptacle, rarely at first included. Receptacle bursting through the bark.
2423. Cryptosphaeria. Receptacle O. Spherules scattered or aggregate, lying beneath the epidermis or bark, orifice various more or less exserted.
2424. Heterospharia. (See Notes.)
2425. Spharia. Receptacle O. Spherules sessile on the surface or slightly immersed.
2426. Lophium. Perithecium vertical, compressed, dehiscing by a longitudinal somewhat closed cleft. Ascı crumbling away.

\section*{Division II. Cytisporei.}

Closed, perforated by an orifice. Asci none; sporidia surrounded by a little bag or thin cellule, deliquescent.
2427. Spheronema. Perithecium opening by a pore, enclosing in a very thin bag some mucous sporidia, which burst forth and become indurated in a globose form. Naked.
2428. Septaria. (See Notes.)
2429. Cytispora. Cellular-many-celled; cells deformed, membranous, united at ends. Nucleus gelatinous, filled with sporules, propelled through the common elongated orifice.
2430. Phoma. Nucleus grumous, enclosed in a tubercle. Sporidia emitted by a simple orifice without regularity.

\section*{Division III. Phacidiacei.}

Perithecium finally bursting, with an open disk. Asci erect, fired.
2431, Dothidea, Nucleus inclosing immersed cellules. True perithecium obliterated, Asci erect, remaining for a long time.
2432. Rhytisma. Perithecium deformed, bursting into transverse fragments by means of a flexuose crack.
2433. Phacidium. Receptacle O. Perithecia sessile, depressed, bursting from the centre towards the circumference in several acute segments. Sporuliferous cells elongated, fixed.
2434. Hysterium. Perithecia mostly oblong, black, corneous, bursting by a longitudinal slit. Sporuliferous tubes erect. (Crust none.)

\section*{Division IV. Xylomacei.}

\section*{Asci obsolete, Sporidia innate.}
2435. Actinothyrium. Perithecium buckler-like, with radiating fibres covering the fusiform sporidia.
2436. Leptostroma. Perithecium uniform, without an orifice, but entirely separating and exposing a very thin disk.
2437. Xyloma. Black, corneous. Perithecia single, solitary and minute, or united and confluent, irregularly dehiscent.

\section*{Observations.}
terrestrial ; the imperfect kinds being inhabitants either of plants or of the dung of animals. Many are meteoric, flourishing most in "Jove tonante, densisque cadentibus imbris;" others are ephemeral; some exist for a month and more.
The Phalloideæ are generally very fætid, cold, and venomous ; one species is accounted in China a vulnerary, and also a food, but of doubtful quality. The old physicians had some peculiar notions about their use in arthritis, \&c. but they are not worth repeating. The Tuberaceæ have a peculiar smell, which is often grateful; their taste is irritating; their qualities esculent, nutritive, and aphrodisiacal.
Class II. Pyrenomycetes. The affinity of this class is very complex, for which reason there is much difference of opinion among authors as to its limits. In fructification it approaches fungi of a higher degree of developement; on one hand resembling the Angiogastres, from which it is readily distinguished by its separate receptacle; on the other hand, the Cupulati, whose differences depend upon the definition of their perithecium. In point of vegetation it descends, first, to Sclerotiacea, which are entirely different, in the absence of an uterus and nucleus; secondly, to Perisporia, which have no distinct perithecium, and no asci ; and thirdly, to several genera of Coniomycetes
2438. Lasiobotrys. (See Notes.)
2439. Asteroma. Black, minute, epiphyllous. Receptacle radiate, filamentous, very adnate, at length tuivercled here and there.

Class III. Trichospermi.
Uterus genuine, forming a receptacle. Sporidia intermixed with flocci.
Division I. Lycoperdinei.
Uterus of a determinate figure, fleshy when young. Flocci copious.
2440. Onygena. Subglobose with a fibrous stipes. Peridium crustaceous, fragile, with interwoven fibres. Sporules naked, compactly clustered.
2441. Tulostoma, Globose stipitate. Involucrum none. Peridium opening by a bordered pore in the summit. Sporules scattered in it.
2442. Scleroderma. Sporangium globose or prolonged into a stipes. Peridium single, coriaceous, mostly warty, bursting at the apex or subdehiscent. Sporules collected into little contiguous distinct globules mixed with filaments.
2443. Lycoperdon. Sporangium globose. Peridium single, membranaceous, scaly, with warts or soft spines bursting irregularly at the apex, and containing a mass of sporules and filaments.
2444. Bovista. Sporangium globose. Peridium double; the outer one adnate, cracking, somewhat fugacious; inner one bursting at the apex, and containing a mass of filaments and pedicellated sporules.
2445. Geastrum. Globose sessile. Involucrum coriaceous, stellate. Peridium membranous. Sporules on stalks from the first.

Division 11. Trichocisti。
Uterus regular, when young pulpy. Sporidia having numerous flocci scattered among them.
2446. Craterium. Peridium oblong, stipitate, operculate, containing a cellulose, filamentous, sporuliferous mass.
2447. Stemonitis. Cylindrical or subglobose. Peridium fugacious. Filaments forming a reticulated mass, perforated by the stipes to which they are attached. Sporules intermixed.
2448. Cribraria. Globose stipitate. Peridium crumbling to pieces at the summit in cracks.
2449. Dictydium. Globose stipitate. Peridium crumbling to pieces entirely or for the most part.
2450. Arscyria. Mostly cylindrical. Peridium fugacious, except a small portion at the base. Filaments abundant, reticulated, fixed at the base, Sporules intermixed,
2451. Leangium. Minute subglobose. Peridium single, membranaceous, bursting into subregular, persistent, expanding segments. Filaments attached at the base and surrounding a columella.

2452, Trichic. Minute subglobose or irregular. Peridium single, membranaceous, bursting. Filaments involute attached at the base, and expanding elastically.
2453. Diderma. Minute subglobose. Peridium double; the outer one fragile and fugitive. Sporules mixed with a few filaments and surrounding a roundish columella.
2454. Physarum. Sporangium minute, mostly stipitate, subglobose. Peridium single, membranaceous, bursting and deciduous in distinct portions. Sporules mixed with a mass of filaments.

2455, Leocarpus. Minute. Peridium single, fragile, bursting, sessile or substipitate, containing a black mass of sporules mixed with a few filaments. Columella 0 .

\section*{Division III. Fuliginoidei,}

Uterus somewhat deformed, sessile, when young pulpy. Sporidia separated by flocci.
2456. Lycogala. Sessile globose or subirregular, pulpy when young. Peridium single, fragile, variously dehiscent. Sporules mixed with a few filaments.
2457. Spumaria. Form irregular, roundish, effused. Peridium soft, at length membranaceous, fragile. Sporules contained in the folds of branched, elongated, membranaceous, persistent processes.

\section*{Division IV. Liceoidei.}

Flocci obsolete.
2458. Dichosporium. Flattened hemispherical. Peridium membranous, coated with a layer of granules. Sporules in globose masses.
2459. Licea, Peridium membranaceous, sessile, fragile, inclosing a pulverulent mass of sporules unmixed with filaments. (No subjacent membrane.)

Class IV. Mucoroider.
Peridium formed of flocci loosely woven together, vanishing in the middle. Sporidia in heaps.
2460. Mucor. Peridium membranaceous, globose, stipitate, pellucid, at length opake. Pedicel simple or branched, tubular, articulated.
2461. Thamnidium. Stipes branched at base; branches bearing solitary globules at their end. Peridium globose.
2462. Ascophora. Peridium membranaceous, stipitate, bursting at length, turned inside out, convex and subpersistent. Pedicel simple or branched, tubular, pellucid, articulated.

\section*{Class V. Perisporta.}

Perisporium thin, somewhat membranous, bursting. Sporidia immersed, scarcely distinct.
2463. Eurotium. Peridia membranous, subglobose, with an articulated floccose innate receptacle. Sporules naked in masses.

2464, Amphisporium. Subglobose. Peridium membranous, thin. Sporules naked of two forms.

\section*{Observations.}

Its extent is very great, ascending from the most simple forms to those which are very compound, but at the same time connected with the former by the most strict natural ties. The true place of the genera in the system has been a subject of doubt. Many authors have taken them for fungi in the most perfect state. Decandolle excludes them from fungi, and, with some analogous Lichens, refers them to a peculiar intermediate family.

They are found in every part of the world in which vegetation exists; for every perfect plant and all its decaying parts nourish Pyrenomycetes. The chief families of trees in the European Flora upon which they flourish are Coniferæ, Amentaceæ, Rosaceæ, Ericeæ, Rhamnoideæ, Acerinæ, and Tiliaceæ, and of herbs, Gramineæ, Umbelliferæ, and Liliaceæ. Many are peculiar to certain species of trees, and others are common to many species. For example, on the Betula alba may be found about ten peculiar species, and from forty to fifty which are common to it and other trees. Their qualities are unknown. Many species which are included by Fries under the name of Ectostroma, are probably not vegetables, and are here omitted.

\section*{Trabe III. HYPHOMYCETES.}

Thallus flocculent.
Class I. Cephalotrichi.
Receptacle distinct, covered over with flocci, with sporidia scattered among them.
2465. Ceratium. Filaments very short, pellucid, simple, minute, attached to a membranaceous, plicate, simple or branched, filiform receptacle.
2466. Isaria. Filaments minute and pellucid, attached to an elongated, simple or branched, clavate, carnose receptacle.

Class II. Stilboider.
Fibres grown together upon the receptacle. Sporidia inclosed in a separate naked head.
2467. Stilbum. Minute. Stipes slender, bearing a little round solid head, which is pellucid and semifluid at first, at length more dense and opake.

Class III. Inomycetes.
Fibres genuine, somewhat separated by divisions. Receptacle none. Upon putrescent organic matter.

\section*{Division I. Byssacei.}

Opake fibres, bearing spore inside, when fertile jointed, when sterile contiguous. Repel misture.
2468. Torula. Thallus composed of branched, rigid, fragile, moniliform, subopake filaments, the articulations minute, globose.
2469. Monilia. Fibres numerous, erect, opaque, distinctly articulated, permanent. Articulations ovate.
2470. Racodium. Thallus composed of branched, decumbent, interwoven, jointless, persistent, subopake filaments, among which are sometimes granules of moniliform filaments.
2471. Dematium. Fibres decumbent or ascending, rigid, opake, branched, continuous in all directions, permanent.
2472. Cladosporium. Thallus composed of erect, rigid, subopake, jointed, simple or branched, aggregate filaments. Sporules ovate, attached in a series to the filaments, deciduous.
2473. Helicosporium. Fibres erect, rigid, nearly simple, opake. Sporules spiral, remotely jointed, some that are fugacious scattered among them.
2474. Ozonium. Thallus composed of decumbent, branched, entangled filaments: primary ones thick, irregular ; ultimate ones fine-jointed.
2475. Rhizomorpha. Receptacle much branched, elongated, coriaceous or ligneous. Perithecia arising from the branches, mostly clavate, dehiscent at the apex.

\section*{Division II. Mucedines.}

Fiocci pellucid, with dissepiments, bearing spore on the outside:
2476. Sepedonium. Thallus formed of entangled filaments, spreading within putrefying fungi. Sporidia scattered, globose. (Bright yellow.)
2477. Acremonium. Thallus composed of decumbent, entangled, branched, pellucid filaments. Sporidia globose, solitary, pedicellate.
2478. Sporotrichum. Thallus minute, tufted or expanded. Sporidia scattered among the branched, tubular jointed filaments.
2479. Trichothecium. Filaments minute, branched, forming a tufted thallus. Sporidia scattered, subglobose, didymous.
2480. Acrosporium. Thallus composed of minute, tufted, pellucid, moniliform, simple filaments, the upper. most joints (sporidia) separating spontaneously.
2481. Botrytis. Thallus composed of decumbent, entangled, branched, pellucid filaments. Sporidia globose, solitary, pedicellate.
2482. Aspergillus. Thallus composed of minute, pellucid, scattered or tufted filaments, apex of the main filament mostly clavate, on which is a head of (often beaded) sporidia,
2483. Stachylidium. Thallus composed of tufted, pellucid filaments: sterile ones procumbent; fertile ones erect, whorled, with ramuli near the top, among which the sporidia are collected.
2484. Penicillium. Thallus composed of tufted, pellucid filaments : sterile ones procumbent ; fertile ones erect, bearing a terminal pencil-like tuft of erect ramuli, to which the sporidia are attached.
2485. Trichoderma. Sporidia collected in the centre, free, the filaments woven into a web-like covering, at length opening at the apex and discharging the globose sporidia.

\section*{Class IV. Phylleriacee.}

Fibres spurious, contiguous, bearing spora inside. Receptucle none. On living leaves.
2486. Rubigo. Fibres infundibuliform or clavate, twisted, situated in patches upon sickly leaves.
2487. Erineum. Peridia flocciform, subdiaphanous, various, subsimple, aggregato-cæspitose, parasitic on living leaves. Sporules sometimes, but rarely evident.

Tribe IV. CONIOMYCETES.
Snoridia naked, without any heterogeneous receptacle.
Class I. Tubercularies. Sporidia naked, simple, scattered over the receptacle.
2488, Tubercularia. Sporangium subglobose, sessile, or somewhat stipitate, carnoso-vesiculose (not gelatinous). Sporidia towards the circumference (color mostly red).
2489. Fusarium. Minute, subglobose, naked, almost wholly formed of fusiform, free, jointless sporidia.
2490. Exosporium. (See Notes.)

\section*{Observations.}

Tribe III. Hyphomycetes. Distinguished from other tribes by their focculent thallus. In no other tribe do flocei oecur in so perfect a state of developement, although they undoubtedly exist as subordinate organs in the Uterini and Hymenomycetes.
Class IV. Phylleriacece. These are perhaps morbid states of the outer integuments of plants. This at least seems obvious in Phyllerium Rubi, Gei, \&c. which are nothing but the hairs of the leaves in a clustered and somewhat altered form. This also may be the reason why there are no sporidia.
Tribe IV. Coniomycetes. To this are referred those fungi in which the sporidia are of a more obvious nature than the other parts of the plant, and so constitute the essence of the fungus. Hence they are more evolved than in any other class. The receptacle, if present, arises either out of united pedicels, or of united sporidia,

Class II. Entophyte.
Sporidia naked, separate, without a receptacle.

\section*{Division I. Stilbosporei.}

Entophytes growing upon dead plants.
2491. Fusidium. Thallus plane, effused. Filaments short, branched. Sporidia fusiform, scattered.
2492. Polythrincium. (See Notes.)
2493. Stilbospora. Black. Receptacle \(O\) ? or a pulverulent mass intermixed with naked sporidia, the whole bursting through the bark in the manner of a Stromatosphæria.
2494. Sporidermium. (See Notes.)
2495. Nemospora. Receptacle \(\mathbf{O}\). Spherules obvious, or somewhat obsolete, discharging sporuliferous puly through the bark in the form of tendrils.

\section*{Division II. Hypodermia. \\ Parasites upon living plants.}
2496. Cylindrosporium. Very minute, parasitic on the surface of living leaves, Sporidia pellucid, cylindrical, truncate, free, not divided.
2497. Uredo. Epidermis of the leaf forming a pseudo-peridium. Sporidia 1 -celled, free, mostly globose
2498. Acidium. Peridium membranaceous, bursting through the epidermis, and dehiscent at the apex, with a dentate or lacerate orifice.
2599. Puccinia. Epidermis of the leaf forming a pseudo-peridium. Sporidia fixed by a pedicel, one or many-celled.

\section*{Observatzons.}
and is homogeneous with the immature sporidia. The thallus is never flocculent. The organs of nutrition and reproduction are the same.

Division 1I. Hypodermia. The genera of this division are furnished with a caliculus, which must not be confounded with the receptacle or thallus, \&c. of other tribes, because it does not constitute part of the fungus, but is formed out of the epidermis of the plant on which the fungus grows.

\section*{HYMENOMYCETES}

Class I. Hymenini, - Div. I. Pileati.
2365. AGA'RICUS. \(L\). Agaric.

Sp. 308-715.

fistory, Use, Propagation, Culture,
2365. Agaricus. This, the most extensive genus in the vegetable kingdom, derives its name from Agaria, a kingdom of Sarmatia. The species are determined upon various principles. Some writers have mixed together species of the most different kinds, as Gleditsch; and a few writers only have really taken pains to ascertain the species. If it is divided into many genera it would be necessary to break up Boletus also, which would scarcely be judicious. An accurate and simple mode of division is, however, of the utmost moment, and several methods have been proposed, the greater part of which are artificial and therefore objectionable; such, for example, as that of Villars, from the magnitude of the species; of Linnæus, from the color of the pileus; of Haller, from the color of the lamellæ or gills; of Withering, from the nature of the stipes and the color of the lamellæ taken together ; or of Otto, from the position of the lamellæ. The divisions of Fries, which are all named as subgenera, depend upon the characters of the veil, the lamellæ, the sporidia, and the pileus Our notes will follow these in their order of succession.
6 1. Amanita. This name was applied by Galen to some eatable fungus, and has been restored in modern days by Persoon. Most of the species are poisonous. They do not perish quickly, and are found for the most part on damp earth in shady woods, never upon wood or the dung of animals. They are in perfection about the end of summer.
A. vaginatus is eaten by the Muscovites; but in the Jena Literary Gazette of 1819 , it is declared to be poisonous. A. ovoideus is said to be delicious.
A. muscarius, or reddish mushroon, has a large pileus, varying much in color, white, red, or crimson, convex, sprinkled with downy warts, which are raised, compact, and angular, or thin, flat, and ragged, turning up with age, from two to seven inches over; flesh white, reddish in decay: gills fixed, white, yellowish with age, mostly uniform, but a shorter one sometimes intervening; the shorter gills varying much in length, but rarely less than one-third the length of the long ones: the stem solid and cylindrical, but the internal substance shrivelling with age leaves irregular hollows; scaly, bulbous at the base, from three to five inches high, and from three quarters to one and a half inch in diameter; ring broad, permanent, and turned down upon the stem. This plant rises out of the ground inclosed within its brown studded wrapper. It is found in pastures. The juice rubbed on the walls and bed-posts destroys bugs; and in the North of Europe, the inhabitants infuse it in

\section*{HYMENOMYCETES.}

\section*{Class I. Hymenini. - Div. I. Pileati.}
* Volva loose : edge of the cap smooth. Unwholesome.

15731 Cap somewhat scaly : edge smooth, Stipes solid nearly equal, Volva loosely sheathed 15732 Cap somewhat scaly ; edge smooth, Stipes hollow at top, Volva connate bulbous

15733 Cap naked : edge smooth, Stipes somewhat fistular equal, Volva booted
** Volvz loose : edge of the cap striated. Eatable.
15734 Cap furrowed at edge, Gills white, Stipes fistular tapering nearly naked, Volva sheathing

15735 Whole piant white, Cap plane or slightly umbonate : the centre often pale ochraceous; margin striato pectinate, Lamella somewhat distant, Stipes solid naked bulbous
*** Volva obliterated : edge of the cap striated. Porsonous.
15736 Margin of the cap striated orange-red shining warty rarely naked, Volva vanishing scaly, Stipes bulbous 15737 Cap equally warted : edge striated, Stipes nearly solid equal, Volva booted adnate
**** Volva obliterated: edge of the cap smooth. Unwholesome.
15738 Warts of cap mealy unequal : edge smooth, Flesh pink, Stipes solid somewhat scaly and bulbous 15739 Cap somewhat umbonate rough with acute warts : edge smooth, Stipes solid somew, taper. squarrulose
* Veil finally separate, Gills distant. Eatable.

15740 Large, Cap scaly, Lamella distant white, Stipes very long bulbous, Collar free 15741 Skin of cap contiguous, Lamella remote, Stipes equal, Collar free
** Veil fixed, Skin of the cap peeling off; Gills separate.
15742 Inodorous, Cap with the epidermis broken into ferruginous scales, Lamella white numerous, Stipes subsquamose, Collar mostly fugacious

15743 Highly odor. Surface of cap white with reddish scales, Lamella distinct, Stipes smooth, Collar fugacious
*** Veil fixed, Gills separate, Skin of the cap adhering.
1574 Cap glutinous striated at edge, Lamella loose, Stipes viscid on account of the veil

and Miscellaneous Particulars
milk, and set it in their windows in order to poison the flies who taste it. This is moucho-more of the Russians, Kamtchadales, and Koriars, who use it for intoxication. They sometimes eat it dry, and sometimes immerse it in a liquor made with the epilobium; and when they drink this liquor, they are seized with convulsions in all their limbs, followed with that kind of raving which attends a burning fever. They personify this mushroom; and if they are urged by its effects to suicide, or any dreadful crime, they pretend to obey its commands. To fit themselves for premeditated assassination, they recur to the use of the moucho-more. A powder of the root, or of that part of the stem which is covered by the earth, is recommended in epileptic cases, and externally applied for dissipating hard globular swellings, and for healing ulcers. The dose is from half a scruple to one, taken thrice a day in water; but a dram administered once a day in vinegar has been thought more efficacious. Murray, App. Med. vol. v. p. 560. Dr. Withering enumerates ten varieties of this species.
§2. Lepiota. Terrestrial, solitary, persistent, autumnal fungi, none of which are noxious. Named from \(\lambda \varepsilon \pi / s\), a thin membranous layer or cuticle. The A. procerus, or tall mushroom, is not uncommon on hedge banks and dry pastures, and is sometimes exposed to sale in Covent Garden market. It may be distinguished from the genuine sort by the sponginess of its flesh; and from others by its fine and large horizontal ring. The gills are white, uniform, and fixed to a collar; the pileus is a broad cone, bossed white-brown, and scaly; the stem is scaly, and the xing loose. This plant, when preserved in pickle, is very apt to run into the vinous fermentation.
A. xerampelinus is the most splendid of all the agaris. Its gills are fixed, bright golden-yellow, and nearly orange under the edge of the pileus, regularly disposed four in a set; fleshy, brittle, and serrated at the edge with a paler cottony matter : the pileus is a fine lake-red, changing with age to a rich orange and buff, and every intermediate shade of these colors, which render it very beautiful; convex, center bossed, edge turned down, three to four inches in diameter, clothy to the touch; flesh pale-buff: stem solid, nearly cylindrical, but gradually tapering upwards, rich buff, shaded with fine rose-red, three to five inches high, half inch in diameter; flesh pale, buffy, spongy, and elastic. This is common in italy, and brought to the markets for sale. The ancient Romans esteemed it one of the greatest luxuries for the table. It was made the vehicle for poison to Claudius Casar by his wife Agrippina, and has therefore been celebrated by Juvenal and Martial.

History, Use, Propagation, Culture,
Schæffer and Clusius have recited several curious circumstances respecting it. Dr. Withering apprehends that these authors have mistaken the species, and that their account should be transferred to the A. deliciosus. The A. xerampelinus is eatable, but its taste is not at all agreeable. It is the A. cæsareus of Schæffer, and first found by Dr. Withering's daughter on the red rock plantations at Edgbaston, July 6th, 1791, and afterwards in September 1793; and in July 1792, among moss in the fir plantations at Tettenhall, Staffordshire.
Dr. W. enumerates five varieties.
§3. Armillaria. From armilla, a necklace. Autumnal species, of permanent duration, firm, and esculent.
*** * Veil fixed, Cap covered, Gills somewhat united,
15745 Cap with furfuraceous scales reddish-yellow, Lamella fixed white, Stipes subsolid covered below the veil with squarrose scales
* Caspitose, Cap s\$2ooth.

15746 Somew. cæspit. Cap thin glutin. Lamellæ annex. dist. Stipes bulb. Collar refiex. and then erect furrowed ** Caspitose, Cap not smooth.
15747 Cap dull-yell, rough with black. hairy scales, Lamellæ adnate-decurr. dist. Stipes fibrous, Coll. tum, spread.
* Cap smooth, floccose at edge. Unwholesome.

15748 Cap smooth whitish, Margin and top of stipes yeilow-flocculent with crisp lamellæ
15749 Cap smooth whitish-pink : edge involute downy, Lamellæ straight, Stipes thickened upwards scaly
* * Cap smooth, Stalk scaly. Eatable.

15750 White, Cap smooth umbon. Lamellæ broad dist. very decur. Stipes white scurfy solid becom. holl. in age
*** Cap finally depressed, Stalk spotted.
15751 Cap umbonate smooth olive-brown, Lamellæ connected white, Stipes solid mottled with brown [yellow 15752 Cap obt. smooth yellow. covered by an olive-colored gluten, Lamellæ distinct and stipes (which is spotted) 15753 Cap smooth cinnamon-col. Lamellæ somewhat decurrent and hollow, Stipes spotted rufous
* Cap truly fleshy, somewhat blunt, humid, viscid; with an involute downy edge, Gills white or yellow, emarginate, Stalk clothed, separate from the cap.
15754. Cap smooth viscid umber-col. Lamellæ annexed white, Stipes solid smooth scaly at end

15755 Cap viscid virgate rufous brown discoidal, Lamellæ annexed yellow, Stipes hollow equal fibrous
15756 Cap smooth viscid red-brown, Lamellæ emarginate white, Stipes equal solid fibrous
15757 Cap somew. depress. visc. granul. and solid stipes eq. scaly at end rose-color. Lam. somew. separate white 15758 Cap somewhat scaly viscid yellow-orange, Lamellæ adnate white, Stipes solid covered with orange scales 15759 Cap scaly viscid yellow-green, Lamellæ separate yellow, Stipes solid thick tuberous
15760 Cap flexuose virgate viscid lurid, Lamellæ emargin. broad and solid, Stipes somew. scaly yellowish-white 15761 Cap flexuose smooth greenish ash-colored, Lamellæ emarginate narrow yellowish, Stipes solid scaly pallid
** Cap always dry, scaly, with the young edge involute, downy, or villous, Gills separate or emarginate, Stalk scaly, separate from cap.
15762 Cap comp. flexuose somew. scaly yellow.-brown, Lamella emarg. comp, and solid, Stipes scaly sulphure. 15763 Cap obt. convex deep-yellow more or less covered with crimson red squamulose fibres, Lameliæ rounded numerous yellow, Stipes solid or partly hollow streaked with red
15764 Cap umbon. rufous, Skin torn with hairy scales downy at edge, Lamella affixed whit. Stipes holl. fibrous 15765 Firm, Cap dry smooth a little scaly brownish-livid, Lamelle emarg. somew, dist. whit. Stipes solid uneq. 15766 White, Cap irregular becoming scaly and cracked, Lamellæ emargin. compact, Stipes solid short smooth
*** Cap always dry, smooth, but often fibriilose, with a nalled edge, Gills separate or emarginate, Stalk solid, smooth, striated, separate from the cap.
15767 Cay umbonate dry yellow-brown fibrous towards edge, Lamellæ emarg. broad and solid striat. Stipes yell. 15768 Cap somew. umbon. dry yellow streaked with black hairs, Lamellæe emargin. broad and solid, Stipes white 15769 Cap umbonate dry grey streaked with black, Lamellæ emargin. broad hoary, Stipes solid striated whitish
**** Cap always dry, smooth, with a thin, fleccose, frosted, involute edge, Flesh soft, Gills rounded, clustered, obliterated in front, Stalk united with cap.
15770 Somew. cæspitose, Pileus smooth unequal cinereous, Lamellæ round, white, Stipes solid powdery at end 15771 Somew. cæspitose, Pileus compact smooth mouse-colored, Lamellæ emarg. and solid downy, Stipes white 15772 Cap somewhat compact smooth with a villous frosted margin, Lamellæ rounded loose and solid somew. bulbous villous, Stem rather violet
15773 Gregarious, Cap thin smooth lilac-brown, Lamellæ rounded pale violet, Stipes solid equal naked 15774 White not spotted, Cap equal smooth, Lamellæ rounded dense, Stipes solid elastic 15775 Cap conical shining, Lamellæ loose white, Stipes solid white
* Gills all equal, Sporidia yellow.

15776 Cap somewhat compact : the margin finally furrowed, Lamellæ broad equal tanned
\& Stipes yellow
15777 Middle-sized, Margin of cap smooth, Lamellæ narrow compact equal : the color of yolk of egg
15778 Cap thin with a sulcate margin, Lamellæ broad subdistant equal yellow

and Misccllaneous Particulars.
They differ much in habit among each other. The annulus is either superior, that is reflexed from the top of the stipes; or inferior, that is contiguous to the middle; or even proper, being inserted above the middle.
14. Limacium. So called from A. limacinus, a name which has been indiscriminately applied to almost all the species of this subgenus. They are fungi of a middle size, solitary, terrestrial, autumnal, and permanent.
5. Tricholoma. From T Gis, hair, and \(\lambda \omega \mu \mu\), a margin. The species are large, robust, and permanent, solitary or gregarious, and terrestrial. Many are eatable; some have an acrid bitter flavor. A. Russula is said to be of excellent quality.

\section*{8. Clitócybe. Fries \\ 15814 gigantéus Leysser. gigantic}

History, Use, Propagation, Culture,
86. Russula. So named from the russet color of the original species. The species are all large, or of middle size, rigid, persistent, solitary, terrestrial, chiefly appearing in the autumn.
\$7. Galarhaus. From roine, milk, and pew, to flow; many of the species being lactescent; some are juiceless, These are fungi of the summer and autumn, possessing an aromatic smell and acrid flavor. They all grow upon the ground. A. torminosus, in times of scarcity, is eaten by the Russians, mixed with salt, oil, and vinegar. Buxb. A. controversus is stated by Persoon to be eatable; but Fries thinks it must be in mistake. A. deliciosus has gills decurrent, flame-colored, narrow, regularly branched; pileus rich, red, brown; flesh A. deliciosus flat, but somewhat hollowed at the centre, and the edge turned in from one and a half to three inches over ; orange-color; stem orange, solid, tapering downwards, from one to two inches high, and a quarter to three-eighths high: hollow with age. The juice is rich yellow, which soon turns green. It is found in the fir plantations of Scotland, and in those of the barren hills at Barr, in Staffordshire. Dr. Smith also found it at Hillingdon, Middlesex, under some fir trees; it also grows near Guildford. It is much esteemed in italy, and exposed in the markets, and supposed to have been the A. cæsareus mentioned by some authors.

15779 Cap compact somew. depressed in centre with marg. at leugth sulcate, Lamellæ broad subeq. very white

> ** Gills nearly equal, Sporidia white.

15780 Cap deformed opaque pallid : margin finally striated, Lamellæ distinct whitish, Stipes finally cinereous

> *** Gills forked, and many of them halved.

15781 Very hot, Cap very red : margin smooth, Lamellæ forked white
15782 Acrid stinking, Cap yellow : margin warted furrowed, Lamellæ connected and hollow, Stipes white
15783 Scentless, Cap greenish : margin smooth, Lamellæ forked white [thick. Stipes sloort solid very robust 15784 Large, Pileus depres. ash color. olive at length dark and as if burnt : marg. smth. Lam. uneq. dist. white \(\beta\) Cap brownish-yellow, Lamellæ yellowish-white, Stipes solid white
* Edge of the cap rolled inwards, downy. Hot. Poisonous.

15785 White, Pileus villous blood-red variegated downy at edge, Stipes solid
15786 Cap yellow without zones: margin bearded, Milk yellowish, Stipes hollow spotted
15787 Cap glabr. pale with a yellowish brownish or greyish tinge : marg. toment. Stipes most. holl. in part smth. 15788 Cap smooth zoned olive-brown: margin villous, Stipes solid
15789 Cap downy dull flesh-colored, Lamellæ yellowish, Stipes rather hollow

> ** Cap smooth, viscid, with a naked edge. Hot. Eatable.

15790 Cap viscid zoned lurid, Lamellæ white, Milk reddish, Stipes hollow
15791 Cap viscid not zoned cinereous-sooty, Lamellæ yellow, Milk turning red, Stipes solid
15792 Cap viscid not zoned fleshy livid or brownish, Lamellæ white, Milk whitish-lilac, Stipes hollow
15793 Cap thin smooth somew. viscid not zoned livid pale, Lamellæ and milk whit. Stipes somew. hollow fragile 15794 Cap viscid not zoned smooth flesh-colored, Lamellæ and milk white, Stipes hollow spotted
15795 Cap viscid somewhat dripping not zoned greenish, Lamellæ and milk white
15796 Cap viscid smooth not zoned and stipes (which is short) hollow and firm pallid, Lamellæ and milk white 15797 Cap glutinous obscurely zoned dingy-orange or reddish very pale when dried, Lamellæ and juice orange, Stipes becoming hollow glabrous
15798 Cap somew. viscid not zoned orange-colored, Lamellæ compact yellowish, Milk white, Stipes long smooth
*** Cap dry, naked at edge, Gills close, when young white, afterwards yellow. Eatable but Acrin. 15799 Sweet, Cap papillose smooth dry orange-colored, Lamellæ paler, Milk white, Stipes long hollow 15800 Sweet, Cap obtuse smooth dry opaque, Lamellæ testaceous rufous, Stipes solid firm brownish

15801 Cap glabrous polished reddish, Lamellæ flesh-colored at length ferruginous, Juice white not changing color, Stipes firm smooth becoming hollow
15802 Somewhat acid, Cap dry smooth somewhat zoned rufous brown, Milk yellow, Stipes solid
15803 Acrid, Cap dry smooth obsoletely zoned pale-yellow, Lamellæ pale flesh-color, Stipes solid 15804 Very acrid, Cap dry umbonate polished reddish-brown, Lamellæ rufous, Milk white, Stipes solid

15805 Acrid, Cap bluntish scaly dry red-ochre-colored, Lamellæ ochraceous, Stipes nearly solid 15806 Cap thin scaly dry opaque somewhat lurid
15807 Cap large dry zoneless dark fuscous or deep dingy-grey, Lamellæ yellowish rather numerous, Juice white **** Cap dry, naked at edge, Gills not altering, Substance compact, tough. Very Acrid. 15808 Cap dry smooth somewhat zoned livid, Lamellæ distant yellow, Stipes hollow cinereous 15809 Cap repand dry smooth, Lamellz distant pallid, Stipes short pallid
[white very acrid 15810 Cap depress. becom. infundibulif. glab. whit. Lamel, very narrow crowded, Stipes solid white thick, Juice 15811 White, Cap umbilicate downy rigid, Lamellæ narrow distant, Milk white, Stipes solid thick
15812 All white sweet, Cap convex, Stipes long
15813 Seems to be a green variety of A. hysgynus, with a solid stipes
A. Gills equally narrowed backward, acute.
1. Cap dry, smooth, Gills close, decurrent or acutely adnate.
* Cap more or less fleshy; when young convex-deflexed, when oider depressed, Gills truly decurrent.

15814 Very large whitish or very pale brown, Cap becoming infundibuliform, Lamellæ numerous decurrent becoming reddish, Stipes solid very thick

and Miscellaneous Particulars.
Dr. Withering enumerates three varieties, one of which affords, from every part of it when wounded, a copious discharge of yellow acrid juice. They are gathered in woods and dry pastures in September and October.
Lösel asserts in his Flora Prussica, p. 82, that "the juice of A. piperatus, mixed with the syrup of mallows, is a certain cure for calculus, and a powerful diuretic." Almost all the venemous fungi, and especially those of the present group, are said to be the favorite food of the goat, during the rutting season. It is sometimes monstrous and irregular. Withering mentions their attaining the diameter of ten inches. The stipes is not unfrequently thicker than it is long. It has been used in medicine, and thought useful in dissolving calculi ; a property we may safely venture to deny it
68. Clitocybe. From x \(\lambda \leqslant \tau 05\), inclined, and \(\approx u \beta \eta\), a head. Most of the species are harmless, and of the larger size. A. nebularis is eatable, so also is A. fusipes. A. giganteus is one of the species which form those circles known by the name of Fairy-rings, the origin of which is still as obscure as ever.
A. orcades has loose gills, with the part attached te the pieus jutting up very close to the stem, so as to give

and Miscellanenus Particulars.
that from its leathery nature it is indigestible, except in the form of powder, in which it is admirable. Dr. Withering, however, observes, that he has seen the pilcus and gills of this agaric very brittle and tender when fully saturated with moisture in rainy seasons, and in that state it is sufficiently digestive. Professor Martyn informs us that he has eaten these mushrooms for forty years without injury, and without perceiving that toughness, like leather, of which others have complained, except in very dry weather, or when they are in too advanced a state. They should be gathered young, and early in a morning, and properly dressed. They are found in hedge banks, upland pascures, and sheep commons, particularly in those patches called Fairy rings. Those that are found in woods and hedges are of inferior favor to such as are gathered in dry pastures, which have a very pleasant smell and luscious flavor, either when stewed alone or in ragouts, \&c. This sort makes excellent ketchup, and is much valued in the form of powder. It is in season during September and October, but may be dried so as to be in use for the table all the winter. Mr. Lighttoot supposes that this species is the

15853 Cap fleshy flat somew. streaked cinere,-whit. Lamel, very broad dist. and solid equal striat. Stipes white

\section*{C. Gills equal, behind blunt.}
7. Cap fleshy, glutinous, Gills somewhat united, Stem rooted.

15854 Cap rugose glutinous tough, Lamellæ white, Stipes tall rigid with a long fusiform root
15855 More slender, Lamellæ sinuated with a decurrent tooth, Stipes very long [blackish towards base 15856 Cap nearly plane brown orange glutin. Lamel, ventric. yellow. Stipes incurv. velvety and redd.-brown or

> 8. Cap tough, dry, Gills separate, close, white.
158.57 Gregarious, Cap fleshy loose, Lamel. somew, separate serrat. Stipes hollow ventricose furrow, whit, root, 15858 Confluent cæspitose, Cap somewhat fleshy whitish, Lamellæ loose compact, Stipes fistulous somewhat compressed red villous powdery
15859 Cap somew. fleshy campanul. expanded umbonate pallid, Lamel. loose, Stipes fistulous smooth glabrous 15860 Variable, Cap thin watery smooth plane sometimes depressed, Lamellæ free soft, Stipes hollow splitting becoming thicker towards the base pinkish or yellowish-white more colored at the summit

> 9. Cap somewhat leathery, dry, Gills separate, distant, pallid.
> * Cap flesidy, Stem solid.

15861 Cap dry leathery convex at length plane, Lamellæ distant pale-reddish or buffish, Stipes solid clothed towards the base with a woolly or strigose mass
15862 Cap tough subumbonate reddish becoming buffish or very pale opake, Lamellæ distant whitish, Stipes solid firm cylindrical thickest under the pileus pale

> * * Cap fleshy, Stom fistulous.

15863 Strong smell. Cap somew. fleshy smth. and lamellæ somew. loose white, Stipes fistular long downy rufous 15864 Cap somewhat fleshy wrinkled dark-purple becom, pale, Lamella loose rufous, Stipes fistular rubiginous
1. Cap slightly fleshy, smooth, scarcely umbilicate, Gills true, Stem hollow, or somewhat fistulous.

15865 Strong smell. Cap somew. fleshy, and lamellæ adnate crisp whitish, Stipes fistular short glabrous rufous 15866 Cap somewhat fleshy smooth pinkish-red, Lainellæ attached white, Stipes nearly solid short scaly
15867 Cap somew. fleshy obt. clay-colored, Lamellæ attached lax white, Stipes fistular rooting smooth yellow. 15868 Cap plane or somewhat umbonate, Lamellæ adnate numerous, Stipes subfistulose slightly tomentose at the base and springing from a reddish tuberous roet
15869 Cap membranous papillose grey, Lamellæ white, Stipes racemose
15870 Cap plano-convex reddish-orange, Lamellæ white rather broad fixed, Stipes very slender subsolid whitish
15871 Gregarious, Cap nearly plane white sometimes changing to reddish, Lamellæ adnate white, Stipes short minutely furfuraceous marked within with a white line
15872 Cap somewhat fleshy convex becoming flat pruinose pale-grey, Lamellæ attached thick distant more obscure, Stipes fistular villous
2. Cap thin, membranous, flat, becoming depressed, plaited, rugose, Gills veiny, of the same substance as the cap, Stem horny, black
15873 Cap flat plaited, and lamellæ (which are very broad adnate and distant) white, Stipes solid smooth brownish thicker and paler towards the extremity
15874 Cap conv. umbilic. plicate, Lam. attach, to a collar surround. stipes white, Stipes holl. striate black below 15875 Cap convex plicate white sometimes tinged with brown, Lamellæ simple adnate white, Stipes hollow furrowed very glabrous purplish-brown or black except at the summit
15876 Cap convex umbilicated plicate redd, -brown, Lamel, adnate pale-yellow. Stipes holl. redd.-brown velvety 15877 Cap fiatt. rugul. pall. Lam. adnate simp. many being halved, Stipes smth. fistular velvety blackish-brown 15878 Cap nearly plane rugose, Lamellæ few adnate resembling white prominent veins, Stipes hollow very minutely velvety reddish-brown below
15879 Cap convex-expanded whitish and rufous, Stipes covered with straight red hairs, Lamellæ whitish

 growing either on earth or wood. Some of the species may be used as food.

History, Use, Propagation, Culture,
810. Mycena. From \(\mu v \pi n 5\), a kind of small fungus. The species are of the smaller kind, at least they are thin and slender, and tolerably permanent. None of them are fit for food; nany are distinguishable by their smell, which is always powerful.
1. Dry, Cap generally umbonate, not depressed, Gills separate or adnate, not decurrent.
* Stem rooting, smooth, juiceless, Gills separate, whole-colored.

15880 Cap becoming nearly plane subcoriaceous, Lamellæ free whitish, Stipes tall covered with a sort of bloom dark purplish-brown below velvety at the base
15881 Cap smooth blackish, Margin and lamellæ loose whitish, Stipes tumid at base, strigose
** Stem smooth, juiceless, somewhat rooting, Gills adnate, whole-colored.
15882 Cap obtuse striated cinereous, Lamellæ adnate glaucous white, Stipes smooth firm villous at base 15883 Cap brown. Lamel. whit. adnate with a decurrent process, Stipes smth. tenacious strig, at base and radicat.
*** Stem juiceless, striated, Gills whole-colored.
15884 Cap obscurely striate blue.-grey, Lamel. attenuated and subadnate whit. Stipes long rigid striate glisten.
**** Stem smooth, milky, somewhat rooting, Gills attenuated, united at the cdge.
15885 Cap striated blackish glaucous, Lamellæ affixed white, Stipes filled with white juice
15886 Cap fieshy-membranous whitish-red, Lamellæ affixed, and stipes filled with dark-red juice
15887 Cap striated reddish-brown, Lamellæ adnate whole-colored at the edge, Stipes filled with red juice
***** Stem smooth, juiceless, somewhat rooting, Gills adnate, discolored at edpe.
15888 Cap striated livid-yellow, Lamellæ adnate linear livid: margin yellow, Stipes rigid smooth fibrous at base 15889 Bright-red, Cap acutely umbonate with a striate margin, Lamellæ fixed dilute reddish, Stipes firm strigose and pale at the base
15890 Cap between fleshy and membranaceous convex pale rose-purple, Lamellæ ventricose rather paler than pileus, Stipes smooth villous at the base
****** Stem smooth, juiceless, scarcely rooting, Gills affixed, whole-colored. Color Pure
15891 Cap between fleshy and membranous obtuse somewhat rose-colored, Lamellæ round ventricose pallid, Stipes smooth villous at base
15892 Cap obtuse smooth, Lamellæ adnate white, Stipes smooth rootless
15893 Cap umbonate striated and slender, Stipes yellow, Lamellæ adnate white
15894 Cap somew. umbonate striated yellowish-white, Lamel. affixed distinct, and stipes rigid smoothish white
******* Stem juiceless, rootless, but swollen at base into a globe, Cap blunt.
15895 Pale-brown, Cap conical smooth, Lamellæ loose compact, Stipes thickish hairy
2. Cap or stem viscid, Gills adnate or decurrent.

15896 Cap obtuse striated and elongated, Stipes yellow viscid, Lamellæ uncinate
15897 Cap umbonate becoming depressed striated cinereous, Lamellæ decurrent white, Stipes short firm viscid
3. Dry, Cap finally depressed, Gills decurrent.
* Firm, persistent, with a firm stem.

15898 Cap somewhat membranous campanulate striated at edge, Lamellæ decurr. very broad, Stipes solid thin
** Delicate, withering, with a capillary stem.
15899 Cap thin hemispher, becom. unbilicat, and striat. Lamel. uncin. decurr. dist. Stipes short incurv. smooth 15900 Thin rosy, Cap campanulate smooth, Lamellæ broad distant, Stipes capillary with a strigose bulb

15901 Slender, Stipes slender with stiff wool at base, Cap depressed hemispherical

\section*{1. Cap somewhat membranous, Gills decurrent.}
* Small, Cap membranous.

15902 White, Cap convex smooth, Lamellæ distant, Stipes attached to the base of a convex radiat. membrane 15903 Cap convex glabrous orange-yellow, Lamelle whitish distant, Stipes yellowish
15904 Testaceous rufous pallid, Cap funnel-shaped : disk smooth, Lamellæ narrow, Stipes firm
15905 Cap convex umbilicated striate, Lamellæ broad pale, Stipes solid short thickish
[at the base
15906 Cap depress, in centre : marg. turned down striate, Lamel. dist, rather broad white, Stipes short pubesc. 15907 Stipes solid thickened at base ferruginous downy

> ** Large, Cap somewhat mombranous.

15908 Tender cinereous blackish, Cap funnel-shaped striated, Lamel. lin. Sipes somew. solid tough vill, at base 15909 Thin pale cinereous, Cap somewhat funnel-shaped smooth oblique, Stipes thick
2. Cap fleshy, membranous, Gills adnate.

15910 Odor. Cap nearly plane pale yellow. or brown.-white when dry, Lamel. numer, whit. Stipes holl. white 15911 Livid, Cap somewhat membranous plane striated, Lameliæ distant, Stipes fistular [attenuat. above 15912 Cap somew. fleshy funn.-shap. smooth dark-brown grey: marg. reflexed, Lamel, dist. grey. Stipes elastir
15913 Cap thin campanulate green at centre brown and plaited at margin, Stipes smooth hollow
3. Cap fleshy, coriaceous, somewhat corky, soft, Gills decurrent.

15914 Cap regular umbilicat. whitish with black. hairy scales, Lamel. denticul. white, Stipes thin minutely scaly

611. Omphatia. From ouqarios, the navel, in reference to the young form of the pileus. Many of the species are of the smallest size. None are eatable.

History, Use, Propagation, Culture,
812. Plcurotus. From s्रोहveov, the side; the pileus is always inserted out of the centre. A tribe of perennial, innocuous, often eatable fungi; always found upon trees.
o13. Mouceron. An old French name of certain eatable fungi. This, no doubt, is the origin of our word Mushroom. A. prunulus is said to be one of the very best of mushrooms; it is common in woods, among grass.
\& 14. Clitopilus. A name analogous to Clitocybe, \& 8 , as the group is also. Species of the middle size, nearly destitute of smell, mild, but not used as food.

15915 Cap compact unequal pale ochraceous, Scales spot-like more opaque, Lamellæ torn, Stipes stout scaly \(\beta\) Stipes long curved, Cap small
15916 Cap tough somewhat lobed twisted smooth rufous, Lamellæ toothed pallid, Stipes firm furrowed rufous
1. Veil universal, Cap compact, horizontal.

15917 Hard, Cap oblique smoothish whitish, Scales brownish, Veil fugacious
2. Veil none, Cap fleshy, Gills decurrent.

15918 Cap tough depressed reddish tan-color, Lamellæ rather crisp paler, Stipes short grey downy
* Cap entire or halved.

15919 Cap tough deformed pink cinnamon-color, Lamel. entire and short irregul. Stipes downy at base and pallid 15920 Tufted, Stipes sublateral or none, Cap smooth fleshy pale blueish-grey or brown, Lamellæ whitish often anastomosing at the base
*** Cap always halved, somewhat ascending.
15921 Ascending, Cap spatulate whitish-brown, Disk and stipes somewhat villous, Lamel. compact lin. white 15922 White, Cap ascending sessile ear-like glabrous, Lamellæ narrow linear quite entire 15923 Cap flattish smooth pale-brown, Margin and lamellæ crenate, Stipes short or none 3. Veil none, Cap fleshy, when young horixontal, Gills terminating in a determinate manner.

15924 Cap compact smooth pale whitish, Lamellæ adnate or subdecurrent whitish, Stipes strong ascending incrassated at the base excentrical
15925 Cap smooth rufous, Lamelle adnate of the same color, Stipes out of the centre smooth whiter
15926 Cap comp, somew, visc, olive-green, Lamel. adnate comp. pallid, Stipes short rather on one side sooty scaly 15927 Cap coriaceous reniform rather tan-colored, Epidermis separating into scurfy scales, Lamellæ veiny connected, Stipes lateral frosted
4. Cap fleshy, when young resupinate, Gills running together in a point out of the centre.

15928 Cap fleshy reniform downy yellowish, Lamellæ orange-yellow
15929 Cap fleshy scaly mouse-color, Upper stratum gelatinous, Lamellæ greyish-white
15930 Cap soft smooth gibbous pale-yellow brown, Lamellæ pale reddish-brown somew. ventricose, Stipes none 15931 Cap membranaceous white cottony at first subresupin. at length reflexed, Lamel. whit. afterw. pink,-buff 15932 Cap fleshy smooth umber-colored: the upper layer gelatinous, Lamellæ pale becoming yellow
5. Cap membranous, Gills adnate, or running together in one point.

15933 Cap reniform diaphanous, Lamellæ linear, Stipes marginal ascending villous
[like Byssus
15934 Cap at first resupinate: afterw. reflex. smooth downy, Lamel. radiat. Stipes thin incurved downy, Roots 15935 Cap subsessile : at first resupinate; afterwards reflexed frosted villous at base, Lamellæ lax

15936 Cap compact flattish white, Lamellæ white becoming pink
1. Gills affixed. Terrestrial.

15937 Cap somewhat umbonate sooty black, Lamel. flat decurr twist. whit. Stipes hollow thlckened downwards 15938 Cap somewhat umbonate silky livid, Lamellæ adnate whitish rose-colored, Stipes hollow smooth white 15939 Cap somew, umbon. smooth livid pale, Lamel. annexed flesh-colored, Stipes solid smooth somew. bulbous 15940 Broad, Cap smonth yellowish-white, Lamellæ loosely attached very broad rufous, Stipes solid equal white 15941 Sinall, Cap convex and stipes white, Lamellæ adnate
2. Gills altogether distinct. Upon Wood.

15942 Cap somewhat membranaceous smooth yellow, Stipes solid striated
15243 Cap fleshy smooth blackish soot-color, Stipes firm with black fibres
15944 Cap convex at length plane clear olive or yellowish-brown smooth but minutely rug. as if velned towards the centre, Stipes hollow rather twisted, Lamellæ ventricose

15945 Cap scaly grey-lilac colored, Lamellæ loose, Stipes hollow fibrous cæsious
15946 Cap somewhat squamose blue, Lamellæ bluish-white adnate at length purple, Stipes solid smooth bluish
15947 Cap irregular smooth somew. cinnamon-colored, Lamel. loose toothed rosy, Stipes hollow twisted striated 15918 Cap campanul. expanded black. soot-color when dry paler and silky, Lamel. almost loose dirty flesh-col.

15949 Cap fibrous scaly livid-grey, Lamel. adnate and fistular, stipes (which is white with wool at the base) paler 15950 Cap squamulose umber-colored, Lamellæ sinuate affixed purplish, Stipes solid short
15951 Cap smooth with a striated edge and the fistular equal, Stipes livid, Lamellæ decurrent 15952 Lamellæ.salmon-colored not numerous, Cap and stem white
and Miscellaneous Particulars.
615. Leptonia. From \(\lambda_{\text {Errros, }}\) slender. Small permanent, elegant, scentless, insipid, not used for food. They are in perfection at the end of summer.
§16. Nolanea. From nola, a bell. Terrestrial, various, of a thin watery substance, insipid, not eatable. Easily distinguished by their habit.
§17. Eccilia. From \&\&zoinow, to excavate. Small, terrestrial, inodorous, insipid.
18. Telamónia. Fries. 15953 tórvus Fries tawny 15954 brun'neus Pers. brown spongiosus With. 15955 everhius Fries 15956 sublanátus Sowerb. half-wøolly 15957 bulbósus Sowerb, bulbous

History. Use, Propagation, Culture,
818. Telamonia. So named on account of their gigantic stature. The species are among Agarics what Ajax Telamonius was among men. Large, terrestrial, firm species, none of which are eaten. The species of this and the next subgenus are extremely difficult to determine; not only on account of their size, but of their colors, which vary exceedingly at different periods of their growth, as well as according to their situation. Their colors are also intermediate between fulvous, testaceous, cinnamon, \&c., which are very difficult to describe The most constant marks are, first, smell; second, surface of pileus being fibrous or viscid; third, the situation of the lamella, whether they are compact or distant ; and fourth, their color in the young state, in which it must be observed, that they are always described.

The A. bulbosus of Hudson and Ray is referred by Withering to A. violaceus of Linnæus; which has fixed purple gills, numerous, eight in a set; long gills, sometimes cloven, and a few of them decurrent : purple pileus, soft, smooth, firm, convex, but centrally depressed with age, and cracking at the edge, which is somewhat turned down, from half an inch to five inches over : stem solid, cylindrical, purple, bulbous at the base, from one to four inches high, and from a quarter to one inch in diameter; and curtain like a cobweb. In maturity it plentifully emits a powder of the color of Spanish snuff. It is not uncommon from October to December, in Edgbaston and Barr plantations, in the woods near Bath, and at Powick, near Worcester. With much broiling and duly seasoned, it is esteemed as delicious as an oyster. Another variety, which is the A. varius of Bolton, is found on grass-plats and new-mown fields in July. It has chocolate gills, from brown to black,

15953 Cap obt. fibrous hoary testac. Lamellæ adn. purple, An annulus sheath. stipes which is violet at upp. end 15954 Cap bluntly umbon, somew, fibr. pale umb.color, Lamel, adnate umb.col. Stipes somew. bulb. striat. paler

15955 Cap somew. fleshy purp.-brown becom. fibrous testac, and hoary, Lamel. violet-pur. Stipes long eq 15956 Cap scaly testaceous olive-color, Lamellæ yellowish cinnamon, 15958 Cap very convex dull or brownish-violet, Lamellæ distant violet, Stipes spongy greyish violet within 5959 Cap umbonate squarrose with hairy sooty scales, Lamellx compact violet becoming clay-colored, Stipes 5960 scaly transversely banded with black
15900 Cap umbon. smooth. pale-brown, Lamel. compact violet discolor. Stipes taper, varieg. with brown scales
. Cap smooth, humia, viscia, always obtuse, finally depressed, Stem blue, becoming white.
15962 Cap equal viscid smooth, Lamellæ compact violet-purple, Stipes bulbous becoming white from violet 15963 Compact rounded, Cap, olivaceous or brownish-grey glutinous while young, Lamellæ reddish-brown tinged with violet, Stipes thick tinged with violet
15964 Firm, Cap yellow somew. scaly humid viscid, Lamel. compact serrat. whit.-cæsious, Stipes tapering white 15965 Cap smooth viscid yellow or tawny, Lamellæ compact quite entire yellowish-cinnamon, Stipes bulb. white 1. Cap scaly or fibrous, Stem same color as the cap or paler. Growing on the earth.
* Cap fleshy, at first convex.

15966 Cap slightly fleshy somew, scaly, and stipes (which is thin and eq.) dull sarig. Lamel. affix. more dull-color. 15967 Cap glabrous subcarnose obtusely umbonate cinnamon-color, Lamellæ numerous adnate yellow-cinnamon, 15968 Stipes yellowish rarely straight
ap pale reddish-buff umbonate subfarinaceous, Lamellæ cinnamon-color broad numerous, Stipes whitish often with a few remains of the veil attached

> ** Cap somewhat fleshy, at first campanulate.

15969 Cap somew. fleshy becom, umbon. smoothish brown-purple, Lamel, affix ventric. ferrugin. Stipes fuscous 2. Cap smooth, but with a few surface-fibres, Stem white. Growing on the earth.

15970 Cap bluntly umbonate pallid, Lamellæ compact cinnamon-colored, Stipes solid tapering upwards white 15971 Cap somewhat fleshy convex becoming bluntly unbonate chesnut-colored, Lamellæ affixed compact violet-testaceous, Stipes short firm
3. Cap smooth, dry, Gills affixed.

15972 Cap convex humid orange-colored or fulvous, Lamellæ yellow, Stipes hollowish
15973 Lamellæ brown-yellow, Cap deep-yellow bossed in the centre, Stipes scored yellow thickset downwards 15974 Lamellæ reddish-buff, Cap pale-yellow bossed, Stipes pale-yellow

15975 Fulvous, Cap fleshy: scales few hairy, Lamelle annexed, Stipes solid smooth, Annulus smal
15976 Cap pitted lemon-colored : hairs white; disk uniform with scatter scales towards disk, Stipes solid white 15977 Compact, Cap yellow: scales scattered appressed, Stipes solid fibrous long-rooted
15978 Cap fleshy brownish or reddish-yellow scaly with fasciculat. filam.: scales revol. Stipes squarr. with scales 15979 Cap fleshy dry yellow: scales hairy scattered, Lamellæ at first yellow, Stipes equal squarrose
15980 Cap slightly fleshy obt. fulvous-yellow vill. with stalked scales, Lamel. adnate: at first yell. Stipes fistul,
15981 Cap scarcely fleshed glabrous striate: when moist dull cinnamon-color becoming pale, Lamellæ subde15982 Cap yellow-brown bluntly conical, Lamellæ brown, Stipes brown scurfy, Veil permanent

and Miscellanious Particulars.
mottled, and in pairs; pileus mouse-color, conical, and pointed; stem of the same color, cylindrical, and firm. This, though a common, is a very beautiful species. In a summer morning it is covered with a bloom like that of a plumb, having often a glittering spangled appearance; its form is regular, and the in wet gravel where peculiarly delicate. Another variety, with the stem of a dark mulberry color, , no grass grows, and somethies is easily rubbed off.
with a white hoariness which is eashe same meaning as Tricholoma, \(\$ 5\)., to which the species are analogous. They are large, firm, somewhat succulent, autumnal, and terrestrial, but not as far as is known, eatable.
20. Dermocybe. From pileus. Analogous to Clitocybe, \(\$ 8\). Of middle size, or small; scarcely eatable. A. cinnamomeus has gills, four in a set, broad about the middle, deep tawny red, and fixed by claws; pileus convex, but bossed, of a rich cinnamon color, from one and a half to three and a half inches diameter; the stem hollow, cylindrical, silky, shining, two inches high, thick as a goose-quill, of a fine full yellow color. This is a species that is readily distinguished by its cinnamon color. It is found in woods in September and October, and has a good flavor.
21. Pholiota. From goids, a scale. Species of various habits. Some are terrestrial, others grow upon wood; some large, others of a smaller size.

History, Use, Propagation, Culturc,
622. Myxacium. So called from \(\mu \nu \zeta \alpha\), mucus, on account of the nature of its surface. The species are large, solitary, terrestrial, mucous, inodorous, and not eatable.
23. Hebeloma. From \(\dot{\eta} \rho \eta\), down, and \(\lambda \omega \mu \infty\), a margin. The only species has a nauseous taste. Its lamelle are serrated, and distil drops of a peculiar fluid. Its varieties are infinite. Common in woods.
\$24. Flammula. So named in allusion to their color, which is a pale yellow, the color of a weak flame. The species are gregarious, subcæspitose, firm, persistent, rather bitter, and all eatable. A. socialis and ilicinus are both eaten at Montpellier, where they are known by the names of Pivoulade d'eouse and Frigoule.
\$25. Inocybe. From sye, fibres, and \(\approx u, \eta_{n}\), a head. A tribe which can scarcely be compared to any other. It consists of fungi of middle-size, or smaller, solitary, growing on the ground during the summer, and not known to be poisonous; although, on account of their nauseous odor, they are suspicious.
\& 26. Naucoria. Small gregarious epiphytous fungi, growing upon stipules, leaves, wood, and even muddy earth, fragile, and without any smell. Their stature is that of Collybia, but their veil is of the same nature as that of Lepiota, resembling the kernel of a nut (naucum), whence they are named.

15983 Cap fleshy smth. orange-brown, Lamel. pur. : then ferrugin. Stipes part. across into bluish gelatin. scales 15984 Cap somewhat fleshy smooth, Lamellæ cinnamon-colored, Stipes long smoothish

15985 Cap somewhat repand opaque, Stipes scaly white, Sporidia clay-color
1. Cap dry, Gills adnate, Tufted. Growing on wood.

15986 Cap smooth yellowish, Lamellæ adnate yellow-forruginous, Stipes fibrous
15987 Cap smooth yellowish, Lamellæ affixed yellow, Stipes fibrous pallid solid

\section*{2. Cap viscid, Gills adnate, Not tufted. Growing upon both wood and earth.}

15988 Yellowish, Cap smooth viscid, Lamellæ adnate, Stipes hollow tapering at base
1. Siem fibrous or scaly with fibres.

15989 Cap fleshy obtuse scaly brownish-grey, Lamellæ free or nearly so, Stipes solid fibrillose
15990 Cap somew. fleshy hemispherical mouse-color, Stipes solid thin long scaly squarr. Lamel. somewhat loose 15991 Cap somewhat fleshy convex scaly-villous, Lamellæ loose and solid: then fibrous, Stipes solid
2. Stem nearly at the top with white scales.

15992 Cap dry campanulate at length nearly plane: surface splitting longitudinally pale shining-brown, Stipes solid somewhat tuberous at the base
15993 Cap conical at length expanded umbonate silky, Lamellæ subadnate, Stipes solid slender sprinkled with white pulverulent particles
15994 Cap yellow-brown scaly, Gills watery white irregular, Stem yellow-brown crooked scored
15995 Cap somew. fleshy scurfy scaly rufous cinnam.-color. Lamel emarg. lin. cinnam.-color. Stipes scaly at end 15996 Cap somew. fleshy : then umbilicat. scaly or silky, Lamel. somew. decurr. cinnam.-color. Stipes fistul. scurfy
15997 Cap dark-brown convex, Lamellæ light-brown, Stipes light-brown
15998 Cap somewhat membranous smooth pallid, Lamel. somewhat loose saffron-color. Stipes long villous white 15999 Cap obtusely conical stri. when moist : when dry smth. ochrac. Lamel. adnate lin. Stipes long glab. fragile 16000 Minute, Cap campanulate striate : when moist reddish-buff becoming pale, Lamellæ adnate rather broad distant, Stipes somewhat crooked filiform
16001 Cap somewhat conical: when dry elastic, Lamellæ few trifid, Stipes very long and slender
16002 Cap globose chesnut-color lobed and incurved at edge, Lamel. trifid wavy, Stipes slender white fistulous
16003 Compact, Cap depressed ochrey-brown with a tomentose involute margin, Lamellæ mostly dichotomous, Stipes thick often excentrical

16004 Cap convex scaly cracked and irregular, Lamellæ orange-brown, Stipes stout somewhat lateral
16005 Cap conv. viscid becom, wrinkled dull-brown : marg. invol. Lamel. adnate yellow. Stipes hard thick black 16006 Imbricated sessile fulvous, Cap fleshy obovate scaly towards the margin
16007 Cap subsessile smooth flaccid pale, Lamellæ watery cinnamon-colored
16008 Cap reniform villous pale tan-color, Lamellæ rounded ferruginous, Stipes lateral tapering upwards white
16009 Cap membranous reflexed silky downy white, Lamellæ whitish
16010 Cap silky white, Lamellæ flesh-colored, Stipes solid tapering incurved, Volva lax 16011 Cap campanulate with scattered scales, Stipes hollow ventricose smooth below

16012 White, Cap dry smoothish, Lamellæ loose broadest in front, Stipes hollow smooth, Annulus ascending 16013 Cap white fleshy dry subsquamose or sericeous, Lamellæ free ventricose pink changing to dark-fuscous Stipes solid white with an annular veil

and Miscellaneous Particulars.
827. Galera. From galea, a helmet, in reference to the figure of their pileus. The species are slender, fragile, tolerably permanent, mostly growing on the ground, and for the most part choosing humid stations, They have neither smell nor use.

8 28. Tapinea. Fungi of various natures, deriving their name from roreivow, to depress. Mostly terrestrial and permanent, but scarcely fit for food.

8 29. Crepidotus. These plants form a transition to Pratella. They grow on wood or trees, and are hardly eatable. A. olearius, a species which grows upon olives in the south of Europe, a poisonous species, exhibits a phosphoric appearance in the night. A. translucens, a French species, is eaten by the poor of Montpellier.
\$30. Volvaria. So called from the magnitude of their volva. The species grow in fertile manured spots, or on wood, are soft and soon perishable. The larger are fit for food.
831. Psalliota. Mostly eatable. Named from \(\psi_{a \lambda \lambda c o v, ~ a ~ c h a i n-b i t, ~ i n ~ t h e ~ s a m e ~ s e n s e ~ a s ~ A r m i l l a r i a . ~}^{\text {a }}\) To this place belongs the common Mushroom, A. campestris, so called from Mouceron, the French name of another eatable kind. It is found all over Europe, the north of Asia, and of Africa, and in North America.

Of all the species of agaric, one only has been selected for cultivation in our gardens, viz. the A. campestris, or common mushroon, or champignon. The gills of this species are loose, pinky red, changing to a liver-color, in contact with the stem, but nut united to it; very thick set, irregularly disposed, some forked next the stem, some next the edge of the pileus, some at both ends, and in that case generally excluding the intermediate smaller gills. The pileus is white, changing to brown when old, and becoming scurfy; regularly convex, fleshy, flatter with age, from two to four inches, and sometimes nine inches in diameter, and liquefying in decay; the flesh white. The stem is solid, white, cylindrical, from two to three inches high, half an inch in diameter; the curtain white and delicate. When this mushroom first makes its appearance, it is smooth and almost globular; and in this state it is called a button. This species is esteemed the best and most savoury of the genus, and is much in request for the table in England. It is eaten fresh, either stewed or boiled, and preserved either as a pickle, or in powder; and it furnishes the sauce called ketchup. The field plants are better for eating than those raised on artificial beds, their flesh being more tender; and those who are accustomed to them can distinguish them by their smell. But the cultivated ones are more sightly, may be more easily collected in the proper state for eating, and are firmer and better for pickling. The wild mushrooms are found in parks and other pastures, where the turf has not been ploughed up for many years; and the best time for gathering them is August and September. Dr. Withering mentions four varieties.
The A. Georgii of Linnæus resembles the former, but is much inferior to it in favor. Its gills are yellowish white; the pileus yellow, convex, hollow in the centre; the stem yellow, thickish, and smooth; the juice yellow, which flows plontifully from it when wounded. It is gathered in September in woods and pastures. A variety of this is found on the sea-coast of Cornwall, of a large size, with the button as big as a yotatoe;

16014 Cap very fleshy convex white or pale-yellowish mostly smooth, Lamellæ broad whitish at length deep purple-brown, Stipes thick with a persistent collar
16015 Cap fleshy smooth yellowish tan-color, Lamellze annexed with a decurrent tooth pale-brown, Stipes nearly solid smooth white

16016 Cap hemispher. smooth glutin.redd.-yell. Lamel. adnate mostly horizont. darkly mott. Stipes holl. squam. 16017 Cap somewhat viscid yellow : scales scattered concentrical, Lamellæ adnate blackish, Stipes solid 16018 Cap scaly greenish-brown, Lamellæ decurrent becoming rufous-brown, Stipes solid bulbous [squamose 16019 Cap fleshy yell. but being cover. with a blue slime appear. green. Lamel. adnate purple-brown, Stipes holl. 16020 Stipes solid white, Annulus persistent, Ca\& yellow-brown, Lamellæ adnate reddish-grey

16021 Cap fleshy very fibrous pale yellow-brown, Lamellæ dull reddish-brown exuding a thin grey fluid, Stipes hollow fibrillose thickest at the base
16022 Cap fleshy obt. brown-orange, Lamel. slightly green. Stipes filled with a spongy mass stained by the veil 16023 Cap somew, fleshy umbon. ochrace. or redd.-orange, Lamel. green. numer. Stipes holl. rather long slender

16024 Cap convex viscid, Lamellæ adnate whitish-brown, Stipes long fibrous
16025 Cap obtuse smooth viscid livid-yellow, Lamellæ broad decurrent brown, Stipes long naked
16026 Cap convex smooth shining, Lamellæ broad adnate blackish, Stipes long naked
16027 Cap light-brown semiglobular, Lamellæ purplish-brown broad thin, Stipes reddish-brown
16028 Cap conical dry, Lamellæ adnate ascending dark-purple, Stipes tough smooth pale

16029 Cap somew. fleshy smooth fuscous-brown pallid, Lamel. adnate numer. brown. flesh-color. Stipes smonth 16030 Cap somewhat membranous campanulate obtuse, Lamellæ very broad at back adnate cinereous-blackish : margin pink, Stipes thin smooth
16031 Cap cinnamon-color conical, Lamellæ dusky-brown, Stipes brownish cylindrical smooth
16032 Cap somewhat fleshy obtusely campanulate glutinous yellowish or brownish-white, Lamellæ adnate greyish-black, Stipes long white, Veil annular entire
16033 Cap somewhat fleshy campanulate humid cinereous pallid, Lamellæ adnate cinereous-black wholecolored at edge, Stipes long rufous, Annulus ragged
16034 Cap somewhat fleshy campanulate dry blackish soot-colored pallid, Lamellæ adnate cinereous-dark white at edge, Stipes long rufous striated at end
16035 Cap convex somewhat umbonate viscid yellow, Lamellæ annexed pallid, Stipes attenuated smooth yellow 16036 Cap membranaceous plicate viscous yellow, Lamellæ scarcely attached to the stipes pale purplish at length brown flesh-color, Stipes equal shining
16037 Cap hemispherical smoothish whitish, Lamellæ loose blackish-purple, Stipes naked white
16038 Gregarious small, Cap ovato-campan, plicate, Lamel. subadnate whit. at length grey, Stipes incurv. glab.

16089 Cap somewhat fleshy white scaly, Lamellæ white changing to red-purple and to black, Stipes subbulbous, Veil annular moveable
16040 Cap membranous white separating into broad scales, Lamellæ blackish, Stipes bulbous naked
16041 Tufted, Cap somewhat fleshy grey becoming reddish-brown smooth scaly at the apex, Lamel. ventricose white changing to purplish-brown, Stipes equal naked

and Miscellaneous Particulurs.
the expanded pileus cighteen inches over, the stem as thick as a man's wrist, the gills very pale, the curtain tough, and thick as leather, and the juice yellowish. A plant of this kind, as Dr. Withering informs us, was gathered on an old hot-bed in a garden in Birmingham, which weighed fourteen pounds.
Greville says," A. Georgii derives its name, according to Parkinson, from springing up about the time of St. George's day. It is unquestionably the largest of the British agarics. It has been known to weigh fourteen pounds. Mr. Hopkirk mentions one that weighed five pounds six ounces, and measured forty-three inches in circumference; but Mr. Stackhouse found it to attain the enormous size of eighteen inches in diameter, which is fifty-four in circumference, having a stem as thick as a man's wrist. The best distinguishing marks are, the extreme paleness of the lamellz at the period of the bursting of the veil, compared with the true mushroom; the greater convexity and thickness of flesh at the same period; and shortly afterwards, the more yellowish and tough pileus."
\$32. Hypholoma. So called, from iø๙s, a cup, and \(\lambda \omega \mu \mu\), an edge. Wood species growing in patches.
633. Psilocybe. From \(\psi \lambda .0 s\), thin, and \(\varkappa u \beta \eta\), a head. A very natural assemblage. The species are for the most part terrestrial, inhabiting fertile and somewhat fenny places, growing either solitary or in groups, not eatable, and subject to much variety of appearance.
84. Psathyra. So called, from \(\psi \&\) 保os, fragile, on account of their remarkable brittleness. Many species are found upon moist wood, and in grassy piaces on a fertile soil.
635. Coprinarius. All the species are found on dung, whence their name, from \(\% 0 \pi \rho \pi\), dung.
2366. Coprinus. Named for the same reason as the last. The species are gregarious and fugacious. They are found on dunghulls, rich grassy places, and in the hollow trunks of decayed trees. The taste of the

\(3-18\) inc. wide 2 jn.nov. Ochr, trun, of trees Grev, crypt, 207
16069 heteróclitus Fr. variable \(2 \frac{1}{6}\) inches wide 0 aut. Or on earth Bolton, t. 164

History, Use, Propagation, Culture,
European species is watery and nauseous; they are therefore not eatable. But in the spice islands, two species, C. moschocaryanus, which is found on the nutmegs, and C. saguarius, which inhabits the pith of the Sago palm, are said to be most delicious. C. cinereus is extremely rapid in its growth, attaining perfection and dissolving in the course of a few hours. At its first appearance, it is covered with the delicate frosted remains of the veil. 2367. Gomphus. So named from their form, from roupos, a club. Large Fungi, scarcely fit for food, with little taste or smell.
2368. Cantharellus. An alteration of the French Chantarelle. C. cibarius is one of the best of our eatable mushrooms. The best way of preserving the plants for use is to string them in rows, after they have become flaccid, and to hang them in a dry place where they can have plenty of air. They then form a delicious ingredient in rich gravies, \&c.
2369. Merulius. A name applied by the ancients to the common morel, Morchella esculenta. Natives of rotten wood, which they soften and finally destroy. M. lacrymans, the dry rot, is a pest to the wood of dwelling houses, which it speedily destroys. It is said to be destroyed by a wash of diluted sulphuric acid. The whole plant is generally resupinate, soft, tender, at first very light, cottony and white. When the veins appear, they are of a fine yellow, orange, or reddish-brown, forming irregular plicæ, most frequently so arranged as to have the appearance of pores, but never any thing like tubes. Sometimes the pileus or substance of the plant, from its situation, produces pendent processes like inverted cones. "The whole fructification often forms a circle of 1-8 inches in diameter." Except in favorable situations, it does not produce fructification, and resembles a dry pithy cottony substance, whence it has been called the dry rot. When in a perfect state, its sinuses contain drops of clear water, which have given rise to the specific name.
2370. Schixophyllum. From \(\sigma \chi \zeta_{S} \omega\), to cut, and \(q u \lambda \lambda o v\), a leaf, in allusion to its lacerated appearance. Found

16042 Tuft. Cap membranac. furrow, furfurac. brown-orange, Lamel, pale chang. to black, Stipes equal fragile 16043 Cap campan. farln. with min, scales, Stipes snow-white tomentose, Lamel. narrow, at length brown.-black 16044 Cap furrowed subtomentose cinereous smooth on the summit, Lamel. lin. Stipes tall attenuated upwards 16045 Cap obtuse scaly scurfy wavy-furrowed sooty, Lamellæ numerous linear blackish, Stipes somewhat silky 16046 Very tender, Cap conical at length plane umbilicated plicate, Lamellæ not reaching to the stipes distant dark-grey, Stipes smooth weak
16047 Ovato-campanulate scaly while young afterwards glabrous becoming expanded and revolute grey or tinged with brown very thin splitting, Lamellæ distant
16048 Very delicate and fugacious, Cap grey furfuraceous at length splitting in a radiated manner glabrous brownish in the centre, Stipes filiform

16049 Cap obtuse giutınous purplish-brown, Lamellæ whitish cinereous
16050 Cap umbonate somewhat viscid rufous-brown, Lamellæ purple umber-colored

16051 Cap slightly feshy umbonate cinereous-blackish, Stipes solid paler, Plaits straight white
16052 Cap fleshy rather depressed downy and solid, Stipes orange-yellow, Plaits straight orange-colored
16053 Rich buff yellow, Cap fleshy irregular smooth : veins tumid, Stipes solid attenuated at the base 16054 Cap funnel-shaped pervious scaly and hollow, Stipes blackish, Plaits distant cinereous
16055 Cap tubeform pervious scaly black umber-color: wrinkles obsolete
16056 Cap coriaceous membranous depressed wavy pallid rugose beneath, Stıpes solid
16057 Horizontal sessile lobed membranaceous dilute brown, Veins branched
16058 Cap submembranac. funnel-shap. waved yellowish or olivac. brown, Veins anastomosing, Stipes holl, yell.

16059 Effused large yellow ferruginous or deep orange : margin white and cottony, Veins large forming irregular pores by their sinuosity

\section*{16060 The only species}

16061 Sessile pale with a woody aspect, Cap suberose rugose glab. Hymenium contorted sinuose anastomosing 16062 Cap somewhat corky depressed rather velvety subferruginous, Hymenium composed of labyrinth-like pores grey fesh-color, Stipes irregular central or nearly lateral
16063 Sessile pallid, Cap coriaceous banded downy, Lamellæ straight somewhat branched
16064 Sessile, Cap corky-coriaceous banded rough brownish, Recesses labyrinth-like cínereous
16065 Sessile cinereous, Cap coriaceous villous banded, Recesses unequal somewhat flexuose becoming ragged 16066 Sessile whitish, Cap corky villous projecting and gibbous at base, Pores linear straightish 16067 Sessile, Cap corky downy banded brownish-cinereous, Pores long narrow olive-yellow

16088 Large, Cap fleshy pale dirty-yellowish with broad dark-colored scales, Pores large angular whitish be coming mere reticulations at the base, Stipes very short
16069 Sessile orange-colored, Cap imbricated lobed villous, Pores large deformed
 and Miscellaneous Particulars.
upon the trunks of leafy trees through all Europe and Asia, the Gold Coast, Cape of Good Hope, North America, the Antilles, and South America
2371. Dadalea. So called from its sinuosities, which appear as if arranged with Dadalean art. Most of the species grow upon wood. The dried substance of \(\mathbf{D}\). quercina is a good styptic. \(\mathbf{D}\). suaveolens has, according to Bolton, a smell like aniseed; and Linnæus mentions, that the Laplanders carry it about them when they visit their mistresses, in order to render themselves more agreeable. From the powder of the plant is prepared an electuary which is said to have been used with success in cases of phthisis. The dose from a scruple to a drachm.
2372. Polyporus. From zo \(\begin{gathered}\text { es, many, and rogos, a pore, on account of the multitude of pores which constitute }\end{gathered}\) its hymenium. P. squamosus is a common species on trunks of willows, oaks, walnuts, \&c. From this was extracted, by Braconnot, the Fungic acid. It is colorless, does not crystallize, has a very sour taste, and when evaporated to dryness, deliquesces upon exposure to the air. The fungates of potash and soda do not crystal. lize, are very soluble in water, but not in alcohol. The fungate of ammonia crystallizes in regular six-sided prisms. The fungate of lime is not altered by exposure to the air, and is soluble in about eighteen times its weight of water at seventy-three degrees.
P. Tuberaster, a species common in Italy, in various parts of the kingdom of Naples, and the Pontifical states, is held in the highest esteem as an article of Neapolitan cookery. P. annosus, a Swedish species, is used by the peasantry as a cure for the bite of snakes. Fries says, that he saw the blood which was flowing from the mouth of a kid which had been hurt stopped in a short space of time by its application. From P. dryadeus, the Boletus pseudo-igniarius of Bulliard, Braconnot obtained his Boletic acid. The color of this principle is white; it is not altered by exposure to the air, and its crystals are regular four-sided prisms. Its

Hisfory, Use, Propagation, Culture,
taste is similar to that of tartar. It is soluble in 180 times its weight of water, at a temperature of sixty-eight degrees, and in forty-five times its weight of alcohol. The aqueous solution reddens vegetable blues. It combines with the different bases forming boletates, which have been but little examined. The boletate of ammonia crystallizes in flat four-sided prisms, and is soluble in twenty-six times its weight of water at sixtyeight degrees. The boletate of potash is very soluble in water, and crystallizes with difficulty. The boletate of lime crystallizes in flat four-sided prisms, and is soluble in about 110 times its weight of water at seventytwo and a half degrees. Polyporus fomentarius is much used on the continent for making Amadou; also very generally in the Highlands of Scotland for the same purpose by the shepherds, who manufacture it for themselves.

16070 Cap fleshy coriaceous thin smooth brownish, Pores very small roundish white, Stipes short pallid
16071 Cap soft fleshy somewhat umbilicated villous sooty pallid, Pores somewhat angular white, Stípes pallid 16172 Cap coriaceous velvety zoned, Pores minute at length lacerated, Plant cinnam.-col. Stipes central 16073 An obscure species scarcely known
16074 Cap concave rich brown scaly, Pores white very short, Stipes whitish thick short
16075 Cap rigid glab. smooth, Pores minute round. pallid, Stipes short smooth pallid abruptly black downwards \(\beta\) Cap rigid glab. smooth, Pores small round. pale, Stipes short smooth pale becom. suddenly black at base
\(\gamma\) Cap yellow ochre-color or whitish
16076 Cap corky and stipes smooth shining, Pores minute round pale
16077 Much branched, Caps halved rugose scoty-grey, Pores white [Pores excessively short min. round whit.
16078 Imbricated scarcely reflex. whit. or brown.-grey, Cap betw. corky and coriac. thin velvety obscure. zoned,
16079 Imbricated multiplied, Caps very broad somewhat banded pale-brown, Pores unequal pale
16080 Multiplied subsessile, Caps broad imbricated smoothish reddish-yellow, Pores minute flat sulphur-colored 16081 Cap subsessile not dimidiate compact smooth pale whitish-brown, Pores white small unequal
16082 Whitish, Cap fleshy rugose hispid obtuse, Pores short roundish
16083 Cap fleshy subsericeous white changing to bluish, Pores minute white irregular lacerated
16084 Cap dimidiate large somew. fleshy thick villous ferrugin. Pores yellowish pale and fringed at the orifices
16085 Caps fleshy corky downy ferruginous, Pores shining greyish ferruginous
16086 Caps fleshy tough villous pale: margin straight blackish, Pores minute round cinereous
16087 Cap fleshy corky not banded glabrous pallid, Pores small equal
16088 Cap fleshy corky not banded villous white, Pores largish brownish
[brown short irregular
B Sess. or dimid. bet. suber. and coriac. round. smooth white at length brown. Pores white becom. yellow.-
16089 Cap mostly reflexed coriaceous villose variegated by zones of different colors, Pores round white short
16090 Caps coriaceous streaked in rays somewhat velvety brownish-yellow, Pores minute
16091 Caps coriaceous smooth not banded pale ochre-color, Pores equal
10092 Effused but at length mostly reflex. Cap thin coriac. vill. white, Pores violet at length brown. and toothed
16093 Cap subtriangular glabrous dark brownish-grey soft within: margin pale glaucous as well as the pores (which are very minute) but at length ferruginous
16094 Hard, Cap thick obtuse smoothish mostly ferruginous blackish at the base banded : margin convex, Pores minute greenish at length cinnamon-color
16095 Effused coriaceous-spongy ferruginous, Pores straight round minute
16096 Effused somewhat wavy hard smooth dry white, Pores middle-size
16097 Broadly effused thin dry smooth white, Pores minute subequal
16098 Effused thick portions sometimes growing out horizontally ferrugin. Pores round. very uneq. Flesh none 16099 Effused thin soft white with a fibrous circumference, Pores thin unequal
16100 Effused coriaceous very thin submarginate, Pores orange flesh-color minute round suboblique
16101 Very fine resembling byssus fugacious white, Pores distant cupulæform powdery
16102 Effus. entirely resupin. very thin white: marg. membran. laciniat. Pores min. subhexagonal very shallow
16103 Cap glutinous varying from bright-yellow to fulvous : tubes adnate yellow, Stipes firm with an annular veil 16104 Cap red-buff, Pores yellow, Stipes bright-yellow, Juice like milk
16105 Cap redd. or brownish-yell. smooth : tubes adnate somew. decurr. large ferrugin. Stipes smooth deep-yell. 16106 Cap round, dry subtoment. reddish or olivaceous: tubes adnate large angul. yell. Stipes very firm smooth
16107 Cap convex subtomentose mostly olivaceous: tubes nearly free round yellow; the orifices crimson-red, Stipes thick reticulated with crimson-red
16108 Cap convex smooth cinereous yellow or brown : tubes nearly free roundish minute whitish at length yellowish, Stipes thick reticulated: flesh white not changing color
16109 Cap convex glabrous: tubes free round whitish, Stipes firm attenuated upwards scabrous
\(\beta\) Cap somewhat rufous with black scales
\({ }_{\gamma}\) Cap slightly glutinous reddish-brown thin : tubes adnate compound yellowish, Stipes smooth
16110 Cap compact somewhat downy: tubes loose round equal, Stipes solid smooth ventricose
16111 The only species

and Miscellaneons Particulars.
2373. Boletus. Pliny, Cæsalpinus, Porta, and others, call these plants Suilli. The Boleti (from Ranos, a field, in allusion to the places where they are found) of the Romans were terrestrial Fungi, and more panticularly Agaricus casareus. By Tournefort these were called Phalloidei ; by Micheli, Morchellæ. The species grow singly upon the ground, are succulent, and have their parts in the greatest perfection of any fungi. B, granulatus is eatable, according to Persoon; so is Boletus subtomentosus. Boletus edulis is excellent when cooked.
2374. Fistulina. So called from the fistulous nature of its tubes; the genus is just intermediate between Boletus and Hydnum, to the former of which it bears the same resemblance as Schizophyllum to Agaricus. There is only one species, and it is said, by Persoon, to be eatable.

History, Use, Propagation, Culture,
2375. Hydnum. The Greeks had their \(\dot{v} \delta v \propto\) and 0 ö \(\delta v, e\), tumours, which were analogous to the tubers of the Romans. H. coralloides is eatable; so is H. leoninum, a Swedish species. A very extensive genus of fungi, chiefly found in moist situations upon the trunks of trees. The pileus is furnished on its lower surface with numerous awl-shaped bodies, which Linnzus compares to the prickles of a hedgehog; they are soft, solid, conical or cylindrical substances, emitting sporules from every part of their surface.
2876. Sistostrema. So named from ouyis nus, part. бuves \(\omega\), compounded, and renux, an orifice, in allusion to the regular rows of pores. Intermediate between the Agarics and Hydna. Gregarious, becoming concrete, fragile, scentless, white, becoming yellow in age. The pilei are thin, somewhat fragile, from half to one inch

\section*{1. Stem perpendicular, Cap distinct, round, nearly entire. Growing on the around.}

16112 Cap fleshy flat tessellated scaly not banded umber-colored, Processes buffish-cinereous, Stipes short
16113 Cap fleshy smooth subrepand buffish, Subulate processes of hymenium unequal pale, Stipes unequal thick
16114 Cap fleshy orbicular somewhat tomentose brownish flesh-color, Processes nearly equal, Stipes thin equal 16115 Cap coriaceous tomentose, Stipes lateral tomentose
2. Stem simple, somewhat horizontal, Cap halved, or out of the centre. Flesby. Growing on wood. 16116 Cap gelatinous papillose, Processes soft pyramidal glaucous, Stipes short lateral
16117 Very large heart-shaped white becoming rather yellow, Cap subsessile fibrous torn, Processes very long 3. Cap confounded with the stem, obliterated. Fleshy. Growing on wood.

16118 Much branched white becoming yellow, Branches entangled tapering, Processes unilateral subulate 4. Cap sessile, lateral. Growing on wood.

16119 Cap coriaceous lobed scaly plaited rufous brown projecting behind, Processes imbricated pale rufous 16120 Effuse-reflexed, Cap coriaceous thin banded ochre-colored, Processes minute numer. ochre-flesh-colored 16121 Coriaceous woody spherical orange-color, Processes short erect
5. Cap resupinate, effuse. Growing on wood.

16122 Effused thin glabrous tawny-ferruginous, Processes in the middle straight
16123 Effused downy pale-white, Processes rounded pubescent at the end bearded with orange
16124 Effus. white at length yellow. with a byssoid marg. Process of hymen. oblique subent. compr, vill, at apex

\section*{16125 The only species}

16126 Effused soft sulphur-colored : the circumference expanded and byssoid, Plaits distant irreguiar
1. Cap entire, with a stem. Terrestrial.

16127 Corky pale, Cap depressed scaly beneath smooth somewhat pilose
16128 Somew. tuft, stipit. or sess. Cap irregul. rarely quite ent. striato-fibr, purplish-brown : marg. often laciniate

\section*{2. Cap lateral, somewhat stipitate. Terrestrial.}

16129 Irregularly tufted dark fuscous, Cap rather thick striato-fibrous sessile often imbricated sometimes with a very short lateral stipes
16130 Ferruginous brown, Caps fibrous scaly ragged and crisp at their edges
3. Cap and stem confounded, running into compressed branches. Terrestrial. Merisma. Pers.

16131 Erect purple-brown, Branches compressed palmate folded paler at the summit
\(\beta\) Somewhat ferruginous, Branches glabrous obtusely ragged fastigiate
16132 Subdecumbent pale greyish or yellowish, Branches effused plane expanding fimbriato-laciniate
16133 Erect distinct stipitate reddish-grey, Cap with branches of nearly equal length, Stipes bulbous at base
4. Cap sessile, lateral. Growing on wood.

16134 Imbricated rigid somewhat zoned purplish reddish-brown glabrous, Hymenium papillose minutely velvety rubiginous paler at the margin
16135 Effuse-reflexed thin silky ferruginous margined downy beneath
16136 Somewhat imbricated bandless smooth on each side very smooth dull-brown
16137 Effuse-reflexed coriaceous strigose, Hymenium smooth yellowish or orange-buff
16138 Effuse-reflexed somewhat membranous striated pubescent beneath smooth and ochraceous
16139 Imbricated subcoriaceous zoned hirsute, Hymenium smooth purple
16140 Imbricated velvety zoned pale reddish-buff, Hymenium smooth irregularly papillose buffish at length ferruginous sometimes shooting out into rude stems anastomosing and producing irregularly caps
16141 Round, thick often conflu. Marg. waved splitting, Hymenium tuberculose yellow. or reddish-brown crack. 16142 Broadly effused thickish, The margin slightly reflexed, Hymenium ochraceous uneven unequally papillose 16143 Coriaceous broad thin, Margin free with the surface tomentose, Hymenium smooth minutely reticulated buff becoming darker in age
16144 Effus. very broad thin, Hymen. somew, of an ochrey pale-yell. smth. or with scatter. uneq. false papillæ
16145 Resupinate, Margin free whitish hirsute, Hymenium fuscous smooth somewhat shining and faintly zoned towards the margin cracking in a radiated manner
16146 Circular effused, Margin sometimes free rarely reflexed, Hymenium pale whitish-brown pruinose silky and minutely byssoid at the margin turning red when wounded

and Miscellaneous Particulars.
broad, somewhat depressed, flexuose, and apt to grow to one another. The only species is found in August and November by the side of sandy paths in pine-groves
2377. Phlebia. So called, from \(\varphi \lambda \varepsilon \psi\), a vein. As the last was intermediate between Agaricus and Hydnum, so is this between Cantharellus and Thelepnora. As that differed from Dædalea, does this from Mertlius, The species are all found upon bark, late in the year No species was described before the writings of Fries, P. merismoides is an elegant little plant, distinguished by its reddish-flesh-colored hues. It is found occasionally gpreading over wood and smooth bark; and scimetimes runs with its papillose veiny branches among mosses.
2378. Thelephora. So called, from \(9 n \lambda \eta\), a nipple, and \(\varphi \varepsilon \rho \omega\), to bear, in allusion to the papillose surface of
\(\left.\begin{array}{lllllllll}16147 \text { quercina Pers. } & \text { oak } & \text { brittle } & 6 & \text { spr. au. } & \text { Blsh } & \text { fallen oaks } & \text { Greville crypt. } 142 \\ 16148 \text { fraxinea Pers. } & \text { ash } & \text { thin } & 1 & \text { aut. } & \text { Grsh } & \text { dead ashes }\end{array}\right]\)

\section*{Division II. Clavati.}

of the pileus of all the species. T. caryophyllæa is very common upon the exposed roots of old firs in the autumn. The substance is tough and somewhat woody; the color a chocolate brown. The plants often grow in masses, attached by their upper side to sticks, old bark, \&c. and are from one to three inches in diameter. 2379. Clavaria. So called, from the simple clavate form of the species, Some are eatable; as for instance C. flava, which is said to be delicious; C. cinerea, which is frequently eaten in France; C. pyxidata is said by Persoon to be tolerably good. Loureiro has also an eatable species found in Cochin-China, growing upon ele. phant's dung.

\section*{5. Cap obliterated, resupinate. Growing on wood.}

16147 Resupinate rigid nearly black beneath, Hymenium flesh-color rugose and papillose at length cracking 16148 Very thin effused cracking and becoming invol. very dark ben. Hymen. brown--grey minutely farin. papill, 16149 Fffus. extremely thin, Marg. appress. minutely vill. Hymen. purp.-grey cover. with small uneq. papillæ 16150 Effused thin smooth, Margin delicate and byssoid, Hymenium whitish at first at length very pale-butf, Papillæ scattered or none
16151 Effused spreading over moss, \&c., Margin fibrous, Hymenium very unequal tuberculose yellowish
16152 Effused unequal in thickness hard, Hymenium white glabrous cracked in different directions so as to be often tessellated obtusely papillose.
16153 Effused membranaceous thin, Margin entire, Hymenium very white glabrous subpapillose
16154 Membranous smooth plaited at base whitish becoming blackish
16155 Effused membranous smooth pale beneath white with cobweb-like down
16156 Effused somewhat rugose soft of a violet-brown : at the margin and beneath downy
16157 Mostly on dead leaves, Filaments very fine white radiating dilated at the extremities in a plumose manner

16158 Broadly effused thin dry smooth glabrous cinereous

\section*{Division II. Clavafi.}

\section*{* Much branched, Stem thick.}

16159 Deformed, Stipes decumbent very thick pale, Branches short somewhat wrinkled red at ends 16160 More erect, Stem thick white, Branches straight round fastigiate yellow
16161 White erect, Stipes thick, Branches elongated irregular unequal mostly acute
16162 Dull ochrey-yellow much branched white and tomentose at the base turning green when bruised, Branches erect crowded slightly rugose with acute often forked summits
16163 White or ciner. tuft. branch, smooth, Branch, dilat at summ. and jagged or shortly but acutely laciniate 16164 Grey often with a bluish or a purplish tinge much branched unequally incrassated rugose often subcompressed, Summits either very obtuse or somewhat acuminate
16165 Yellow half an inch high branched or nearly simple viscous, Stipes of several plants connected at the base
** Branched, Stem thin.
16166 Much branched pale brownish, Branches and branchlets straight appressed acute
16167 Yell. tuft. Stipes short producing numer. short geniculate divaricate branches: the ramuli subfastigi. obt. 16168 Yellow erect much branched in a dichotomous manner, Branches slender with acute summits 16169 White gregarious incrassated rugose simple or branched, Branches few short obtuse
*** Simple, clavate.
16170 Solitary large glabrous yellowish-brown thickened upwards and obtuse
16171 Very long hollow thickened upwards brownish downy at base
16172 Heaped fascicled yellow, Branches nearly equal incurved yellow
161/3 Fascicled unequal subdivided hollow yellowish-brown at end
[irregular at the apex
16174 Yell. or yell.-white tuft. or gregarious fragile uneq. ventric. deformed somew. acum. often bifurcate and 16175 Yellow or white gregarious sometimes subcespitose solid or hollow very brittle rather firm attenuated at the base subrugose in age and often crooked
16176 Straight white, Head distinct round acuminate as long as stipes
16177 Stem slender villous, Branches long compressed, Branchlets numerous setaceous cut
16178 Yellow gregarious cylind. equal smooth obt. slender below and paler, apex frequently of a cinnamon-color 16179 Pure white tuft. crowd. subul. fiexuose solid but with a small perforat. mostly somew. connected at base 16180 White gregarious round club-shaped obtuse much attenuated at the base smooth not brittle
16181 White minute, Hymenium oblong or ovato-clavate passing suddenly into a filiform pilose stipes

16182 Tough yellowish nearly simple, Stem tuberous long-rooted
16183 Tufted smaller simple and branched viscid yellow connate at base
16184 Stipes hirsute deep-black, Hymenium somewhat plicate

and Miscellaneous Particulars.
2380. Calocera. From \(\approx \alpha \lambda 0\), beautiful, and \(x s \rho \propto 5\), a horn, in allusion to the divisions of the plants. They grow on wood, and are either brown or yellow; but their sporidia are generally white. C. viscosa is at once distinguishable by its beautiful gold color. Some of the species adhere to paper when dry.
2381. Geoglossum. From \(\gamma \eta\), the earth, and \(\gamma \lambda \omega \sigma \sigma \alpha\), a tongue; earth-tongue : in allusion to the simple form of the species, which all grow upon earth, and are of a blackish or dark-green color. Fries considers the genus to be searcely distinct from Clavaria.

History, Use, Hropagation, Culture,
2382. Spatularia. A very distinct genus, named from its spatulate form. The only species known is an autumnal epiphyte, common on fallen leaves, decaying mosses, \&c. Its color is at first pallid; afterwards it becomes yellow and ferruginous: but the stipes retains its paler color. It is found in plantations in various parts of England. In a state of perfect maturity, the head, on being touched, throws up its sporules in the form of smoke, which rises with elastic force, and glitters in the sunshine like particles of silver.
2383. Mitrula. So called from its mitrate form. The species are small epiphytes with a simple stem.
2384. Typhula. A diminution of Typha, a well-known marsh plant, the heads of fructification of which this genus resembles in miniature. All the species are delicate, and are found upon decayed leaves, or even occasionally upon Sclerotias.
2385. Pistillaric. So called from its pistil-like form. The species are all small, delicate epiphytes, appearing in the autumn.
2386. Morchella. A name altered by Dillenius from Morchel, the German name of the plant. Fungi of a large size, appearing in the spring upon the earth. The eatanle morel is one of the most valuable of fungi for purposes of cookery; but is more frequently used in a dried state for sauces, than when fresh. It is found in greatest abundance in places where trees have been burned, which led in Germany to a practice of burning down masses of forests for the sake of the future morels. This practice proved so injurious, that it became necessary to suppress it by law. The morel is subject to many variations of figure and color, which are all referable to four principal forms. But there are also some legitimate species which have been distinguished by modern botanists. Of these it is not ascertained which are natives of England; but it is probable, that they are all to be found if sufficiently sought for. Without, therefore, absolutely inserting them in the list of British species, it cannot be otherwise than useful, considering the importance of an accurate knowledge of the eatable fungi, to enumerate the two principal in this place.
1. M. Deliciosa is found in the spring, among grass and bushes by the sides of fields in France, and is said to be much superior in flavor to the M, esculenta. Its stipes is hollow, and shorter than the pileus, scarcely ever so much as an inch long, about three or four lines thick, nearly equal in the whole length, but sometimes thickened and compressed at the base ; under a lens covered with a slight downiness. Pileus is conical-cylindrical, from one inch to two inches and an half long, with nearly parallel ribs, which can scarcely be said to

16185 Glabrous dry blackish, Stipes somewhat scaly
[thin and attenuated downwards
16186 Smooth very slimy in moist weather black, Hymen. cylind, round. at apex confluent with stipes which is 16187 Green somewhat fasciculate, Hymenium distinct, Stipes minutely scaly

16188 The only species

16189 Yellow subgregarious, Cap orange-yellow obtuse hollow : margin connate with the stipes
16190 Very small, Head lanceolate yellow, Stipes equal paler
16191 Gregarious solid, Hymenium ovate yellow cinnamon, Stipes slender dark-brown flexuose at the base

16192 White filiform elongated somewhat villose at the base radicular tuber dark fuscous lenticu.ar 16193 Gregarious min. Hymenium smooth white short terminat, in an elongated filiform dark pink-red stipes 16184 Simple smooth dark thickened at end
16195 Somewhat branched spadiceous, Heads thickened whitish

16196 Thickened towards the extremity white confluent with the stipes

\section*{Class II. Uterini v. Elvellacere, - Division 1. Mitrati.}

16197 Cap round. or oval : marg. contract. round the stipes, Areolæ much hollow. Stipes white dilat. tow. base \(\propto\) Cap and areolæ round
\(\beta\) Cap oval, Areolæ quadrangular
16198 Cap obtuse separate as far as the middle, Areolæ rhomboid, Stipes smooth
[thick white
16199 Cap short conic. spread, at base, A reole shall. partly formed by longitudin. parallel ribs, Stipes long equal
* Cap waxy, membranous, at first united, afterwards wavy in plaits.

16200 Cap irregularly deflexed free often variously lobed yellow.-white, Stipes deeply sulcate and lacunose white 16201 Cap dark-livid inflated deflex. and partially adnate with stipes, Stipes deeply furrow. and lacunose white 16202 Cap inflated deformed wavy wrinkled in circles brown, Margin villous adhering to the smooth stipes 16203 Cap deflexed lobed adnate about cinnamon-colored, Stipes smoothish villous pale
** Cap somewhat membranous, smooth, always separate.
16204 Cap loose smooth inflated becoming sharply lobed, Stipes long thin tapering pruinose

16205 Cap campanulate smoothish fuscous somewhat sinuated at the edge : beneath and the stipes yellow

and Miscellaneous Particulars.
anastomose, but which are united by transverse rugosities. The color is usually yellowish, rarely of a pale livid bue.
2. M. elata has a longer stipes than the last, an inch and more thick, very hollow and brittle, with irregular cavities. The pileus is ovate-conical, two or three inches long, but of a far more delicate texture than any of the others. The longitudinal ribs are much elevated, membranous, flaccid, with very few anastomoses, but united by transverse costæ, which give the spaces between a sort of misshapen rhomboidal figure. The color is a soft brown. The flavor is watery and vapid, and in decay becomes so fetid as to be unfit for food. This is found in pine-woods, erpecially in humid places. It is a rarer kind than the last and like it, appears in the spring.
M. patula and semilibera are readily known from the true morels by their pileus not being attached to the stipes by the base, but altogether separate from it. They are distinguished from each other by the latter having a much longer stipes, and a shorter pileus, which is more conical and acute. M. patula is considered by Fries to have been confounded, in Mr. Sowerby's fine work on Fungi, with Helvella esculenta.
2387. Helvella. A name employed by Cicero, as the name of a fungus. The species of the modern genus are permanent, somewhat fragile fungi, with little odor or taste, but always innocuous. They grow on the earth or upon very wet wood, and are chiefly found in the autumn. H. crispa is excellent as an article of cookery. H. lacunosa, which is confounded with it, is jy no means so good. H. esculenta has a good flavor, and is commonly eaten, but is far inferior to Morchella esculenta. Its qualities are nearly the same as those of the latter plant, and it is popularly confounded with it under the name, in Sweden, of Stenmurlla, and in Germany, of Gemeine Morchel, Stumpf Morchel, and Stockmorchel. H. infula, a large species, with an inflated smooth pileus of various hues of brown, is also esculent. This last plant is the true H. Mitra of Ruppius, and old botanists; a name which, having been applied by one writer or other to every species of Helvella, is now abandoned altogether in order to avoid further confusion.
2388. Verpa, An old Roman name synonvmous with Phallus, and restored to modern science by Swartz. The species are meteoric, terrestrial, and intermediate between the Morels and Leotia. The hymenium is covered, as is the case with many Mitrati, with a frost-like flocculence, which Swartz mistook for sporules, but which more recent observation has shewn to have been a mistake.

\section*{History, Use, Propagation, Culture,}
2389. Leotia. Named by Sir John Hill, of famous memory, for no known reason. Gregarious terrestrial substances of the middle size, appearing in summer or autumn, without smell or taste. They are most nearly akin to Helvella and Verpa, from which they differ in form and substance. The species are not known to be eatable, with the exception of \(L\). amara, a native of Cochin-China, which is capable of being deprived of its native bitterness by long stewing.

16206 Cap depressed cinereous livid smooth on each side, Stipes solid smooth
16207 Dwarfs, Cap rugose white beneath smooth brown, Stıpes solid cylindrical white
16908 Tremellose, Cap tumid spread, olivac. : margin rounded, Stipes orange-cylindr. or unequally compressed

\section*{Division 11. Cupulati.}
1. Cupule always open, or when young conniving, Veil superficial, Sporidia with two smaller sporidia. Helvelloidee.
16209 Cyathiform sooty veiny on the outside arising from a short fistulous pitted stipes
16210 Subsess, ent. flexuose brown, Margin at first involute externally pruinose paler and somew. olive-colored 16211 Substipitate lengthened on one side ear-shaped somew, ferrugin, mealy outside smooth inside at the base 16212 Substipitate lengthened on one side ear-shaped farinaceous outside pink inside becoming rugose at base 16213 Gregarious fiexuose very brittle white externally, Hymenium fine orange
16214 Cæspitose large very brittle externally lemon-colored becoming wrinkled pale flesh-color inside
16215 Gregarious cæspitose variously contorted externally yellowish-brown, Hymenium dull reddish-brown 16216 Large funnel-shaped repand yellowish villous and whitish outside and upon the stipes-like base [base 16217 Gregar, cæspit. glob. at first with mouth conniv. at length campan. splitt. externally whit. and toment. at 16218 Sessile solitary or somewhat tufted large at first hemispherical and concave at length nearly plane subrugose and brown within the outer surface farinose whitish, Margin crenate
2. Cupule at first closed, Veil innate, Sporidia simple. Geopyxis.

16219 Subgregarious large: the pileus hemispherical slightly hairy and verrucose ash.colored; the hymenium mouse-colored at length pale, Stipes very long incrassated below
16290 Thin, Cupule funnel-shaped brownish pallid, Stipes long seated on a black deformed root
16221 Subsessile thin globose campanulate brownish or pale mealy outside crenate at edge
16222 Sessile yellowish smooth at first urceolate afterwards cracked and torn with hairs about the root outside 16223 Sessile minute flattish orange-red externally granulated with pimples. [Stipes usually short and thick 16224 Centre plicate and reticulat. without whit. and pruin. Cap invol. at margin variously split somew. spread.
3. Cupule a little fleshy, small, Veil floccose only at the edge, or fugacious, Sporidia with a solitary little sporidium. Humaria.
16225 Sessile clustered subcylindrical smooth somewhat yellow becoming dilated with an erect subciliated orifice 16226 Sessile fleshy plano-convex smooth crimson entire at margin
4. Membranaceous, bursting forth with a separating veil, Sporidia simple. Encelia.

16227 Subcæspitate sessile coriac. membran. Margin split ragged externally scurfy and brown, internally white
1. Cupule fleshy, or fleshy-membranous. Crust none. Sarcoscyphe.

16228 Stipitate large subinfundibuliform externally white and tomentose, Hymenium crimson-red
16229 Cupule fleshy, Disk urceolate black externally rubiginous-flocculent, Stipes short down dense dark strigose 16230 Subcæspit. fleshy sess. from hemispher. becom. flatten. Disk sulph. external. and thick root white and vill. 16231 Sessile hemispherical wavy brownish externally covered by dense fascicled hairs, Disk glaucous white 16232 Sessile subhemispher. externally fuscous hairy with a somewhat inflexed margin, Vermilion colored inside 16233 Min. sess. or subsessile hemispher. externally tomentose-pulverulent yellowish-olive, Hymen. dull ochrac. 16234 Sessile gregarious or scattered nearly plane : extemal surface of the margin hispid with black rigid hairs, Hymenium orange-red
16235 Sessile gregarious very minute orbicular somewhat depressed substrigose brown or nearly black 16236 Plane ciliated blackish externally, Hairs pale, Disk bhe [at margin. Hymenium gently umbonate 16237 Small sess. gregar. whole plant white glob, concave at length quite planeciliate with horizont. white hairs 16238 Gregarious concave tawny externally surrounded near the edge with straightish brown hairs [white 16239 Sess. gregar. glob, at length quite plane, exter. surface and marg. strig. with redd.-brown hairs, Hymen. 16240 Sessile gregarious small globose at length plane: the strigose external surface yellow, Hymenium white
2. Cupule waxy, dry, villous, Crust none. Epiphytes. Dasyscyphe.

16241 Stipitate gregarious small, Stipes rather long, Pileus hemispherical subpatulose villous, whole plant white 16242 Subsess. small gregar. externally very white vill. Mouth contract. Hymen. varying from dil. yell, to orange 16243 Sessile hemispherical orbicular rather firm flocculent, Disk urceolate whitish
16244 Sessile distinct concave villous hairy milk-white on each side granulated at edge
16245 Sessile very minute gregarious white subglobose villous, Mouth more or less connivent
16246 Sessile minute gregarious depressed externally fusco-olivaceous villose, Hymenium smooth bluish-grey 3. Cupule waxy or coriaceous, seated on a downy crust. Tapesia.

16247 Substipitate much crowded form. a crust, Cupules turbinate vill. light bistre-colored : disk urceol, whitish 16248 Sessile gregarious obovate strigose rufous
16249 Sessile gregarious ovate globose golden-yellow strigose with a subjacent woolly paler web
16250 Carn. sess. Cup. concave brown at length plane grey : marg. glab. attach. by fibres to a wide toment wet

2390. Peziza. Pliny had a tribe of Fungi which he called Pezica, from which the modern name has been corrupted. The present genus is very extensive, but almost wholly of modern creation. The species are found in various situations, but chiefly on decayed wood. They are remarkable for their leathery texture, and for emitting their sporules in the form of smoke from the bottom of their cup.

\section*{1. Cupule somewhat membranous, distinctly stalked, Hymenium distinct. Hymenoscypar.} 16251 Rather large ochrey-brown infundibulif. at length concavo-rep. or very plane, Stipes elongat. dark at base 16252 Cap smooth urceolate orange-color with a prominent membranous pale margin, Stipes cylindrical pink 16253 Gregar. yell. or redd.-white subinfundibulif, : surface of hymen. plane, Stipes long subflexu, and attenuat. 16254 Bright-yellow, Cupule plano-convex thinnish, Stipes short firm thickish
16255 Stipit. glab. white or yellow. subinfundibulif. Margin fringed with inflexed teeth, Stipes elongated curved 16256 Stipitate campanulate, Margin smooth, Stipes straight
2. Cupule fleshy, wixy, firm, obconical, somewhat stalked, Hymenium distinct. Calycine

16257 Yellow, Cupule turbinate: disk flat ; margin tumid, stipes long slender [orange-brown 16258 Gregarious globoso-infundibulif, slightly concave, Stipes rather short attenuat, whole plant ferrugin. os 16259 Fruginose, Cupule turbinate becoming expanded and flexuose: disk whitish, Stipes short

16260 Cupule subrepand smooth : disk yellow exteriorly white as well as the somewhat ascending stipes 16261 Yell crowd. apparently sess, but having a short thick obconical stipes carnose, Hymenium plano-concave

16262 Crowded smooth pale-yellow or whitish, Cupule concave, Stipes short thickish pallid
16263 Hemispherical margined, Disk yellowish externally sooty, Stipes very short whitish
16264 Gregarious white rather small very membranaceous campanulate unequal, Stipes filiform short
16265 Black solitary rather large very concave, Hymen. cribriform or full of lacerat. irregular pores or sinuses 16266 Yellow gregarious minute obconical at length somew. plane, Margin raised obt. externally somew. paler 16267 Yellow very minute gregarious punctiform globular at length plane or subconvex, Margin minutely cren. 16268 White gregar. carnose at length convex but sometimes depress. in centre turning reddish in age and decay
3. Cupule waxy, soft, watery, sessile or obconical, Hymenium confluent. Mollisia.

16269 White gregarious excessively minute orbicular subimmarginate
1627 G Fulvous orange gregarious crowded minute nearly plane subtremella-like
16271 Grey gregarious depressed waved subtremellose, Margin obsolete
16272 Sessile somewhat tufted membranous soft smooth whole-colored all over and whitish
\(\beta\) Scattered flattish-urceolate whitish transparent
[in wet weather
16273 Minute ceraceous glab. sess. grey connate within the semiputrid petioles of the Sycamore and burst. forth

> 4. Cupule waxy, dry, sessile, flat at base or innate edged. Patellea.
16274. Ochrey-brown min. gregar. carnose thick obconic. Hymen. minutely granul. at length plane or subconvex 16275 Green gregarious minute subtremellose hemispherical at length plane becoming black in decay 16276 Sessile dry patellate cæsious on the outside, Disk yellow

16277 Firm, Head convex yellow black-brown beneath, as is the short thick villous stipes 16278 White smooth, Head convex, Stipes long equal

16279 Sessile gregarious somewhat concave olive-green or brownish externally furfuraceous
16280 Turbinate firm, externally rugulose scaly umber-colored, Disk flattish blackish
16281 Polymorphous cæspitose subgelatinous somew. firm purplish-red externally subvenose, Hymen. concave
16282 Disk flattish golden-yellow, Stipes thick villous white long-rooted

16283 Simp. gregar. long flexu. at first closed pruin. and blackish.cinereous, afterw. open with a broad pale disk
16284. Substipitate opake rigid black marginate, Hymenium concave

16285 Coriaceous reddish-black at first closed at length expanded and plane
16286 In round. tufts, Caps stipit. subturbin. concave with round. marg. intermix. with digit. or subul. processes 16287 Gregarious between membrane and leathery subsessile rugose somewhat pruinose, The orifice compressed inflexed: when moist spreading

16288 Immersed orbicular, Limb snow-white ragged pulverulent

and Miscellancous Particulars.
autumn until the spring. They are to be considered noxious fungi from the injury they bring to the timber upon which they vegetate. Their mucilaginous roots insinuate themselves between the fibres of the wood, and separate and soften them. Their tubercles burst forth, and filling the wood with clefts, and rendering jts interior accessible to wet, soon destroy it. D. radicata is one of the species of dry rot.
2394. Cenangium. From zevas, hollow, and reyriov, a capsule or vessel, in allusion to the hollow nature of the receptacle. Chiefly distinguished from Peziza by substance, and the coriaceous nature of the cupules, From Tympanis it is distinguished by its closed cupules and smooth permanent hymenium. The species are small and deformed, growing upon the bark of trees, either singly or in tufts, and mostly produced in winter.
2395. Stictis. So named from the punctiform appearance of many of the species, from stzros, a dot. Very simple, minute, gregarious fungi.

\section*{History, Use, Propagation, Culture,}
2396. Cryptomyces. Upon this curious addition to the British Flora, Dr. Greville has the following remarks, "This very curious plant, I have little hesitation in placing as a new genus among the true Fungi. It is difficult to say, with what it has nearest affinity. In general habit, it might be supposed to resemble some species of Thelephora, but there the comparison stops. Our plant, besides being produced under the epidermis, seems to belong to a more perfect group, when its structure is examined. The hymenium is a quite distinct substance from that of the receptacle. The fructification is fully and beautifully developed, a good deal similar to that of the Helvellæ. The receptacle is carnose and white; and the whole exhales a very strong odor, precisely like what is universally known under the name of a fungus-like smell. Till the plant is perfected, it remains concealed beneath the epidermis; and on this account, I have named the genus Cryptomyces. The epidermis, in fact, scarcely seems to crack by the swelling of the fungus, more than by the natural consequence of being killed by its separation from the subjacent bark, A cluster of willows, which was attacked in the beginning of the season by this plant, has been nearly destroyed by it; and, from the rapidity of its progress, i have no doubt that a whole plantation might, in the course of a couple of seasons, be rendered good for nothing. At a little distance, the affected branches look as if they were dry, scorched, and rotten."
2397. Tremella. Large or middle-sized fungi, rooting at the base, which is considerably contracted between the bark and the wood of trees. Dillenius named the genus on account of its soft, tenacious, tremulous substance, but his name was applied in a far more extensive sense than at present. The section called Phyllopta is an aberrant form of the genus, and should perhaps be separated.
2399. Exidia. From \(\varepsilon \xi \xi \in \mu\), , to proceed froin a thing; with reference to the manner in which the sporidia cxude as it were from their receptacle. This genus differs from Tremella, to which it is nearest, in its horizontal Pezizs !ike receptacle; in its hymenium being superior, the lower surface being dissimilar and either

16306 Stipitate mostly lanceolate somewhat obtuse subcompressed of a dark olivaceous color
16307 Separate spherical whitish-yellow becoming wrinkled and black, white inside
\(\beta\) Clustered somewhat immersed pale inside
16308 Deformed lobed smooth pale becoming tawny, whitish inside

\section*{and Miscellaneous Particulars.}
villous or rugose, and ribbed in a peculiar manner; in the conoid papillæ of the disk; in the tubes, which must be esteemed rudimentary asci, containing the sporules; and in the elastic manner in which the sporidia are produced. The species are simple, rarely growing in patches, of a large or middle size, and generally inhabiting wood; when dry they are membranous, but nearly regain their original form upon being
moistened.
2399. Dacrymyces. From \(\delta \alpha z \rho\), a tear, and \(\mu u z \eta\), a fungus; in allusion to their deliquescent nature. Tremella deliquescens of Bulliard, a yellow confluent mass found chiefly upon pine-timber in the spring, is tre type of the genus.
〔400. Agyrium. Apparently from arugs, a crowd, in allusion to the clustered disposition of the individuals; although Fries, the author of the name, expressly declares that it has been named "s ob superficiem nunquam non lævem." Small dot-like gregarious plants growing upon wood, perennial, seated upon a crust-like spot, and resembling some species of Lecidea,
2401. Hymenella. This genus consists of plants growing upon plants, generally upon the stem, having the habit of Sclerotium durum, but softer, more tender, and bearing sporidia within their surface, for which reason they seem as if they consisted only of a kind of elementary hymenium, whence their name.
2402. Namatelia. From sorux, gelatine, and \(\varepsilon \lambda \lambda \epsilon \omega\), to enwrap, on account of the nucleus, which is of various figures, enclosed in the receptacle.
2403. Acrospermum. Minute fungi of a rigid habit, parasites upon decaying vegetables. From \(\alpha \approx \rho o s\), the summit, and \(\sigma\) reg \(\mu m\), seed, on account of the apex of the plants becoming tumid, and emitting the sporules.
2404. Sclerotium. From \(\sigma=\lambda\).ngos, hard, in allusion to the remarkably firm substance of the species. All the species are parasites upon other plants, and some are very destructive.

History, Use, Propagation, Culture,
2405. Rhizoctonia. Subterraneous fungi, reposing upon the roots of living plants, which they destroy. The species appear in the summer or autumn, and are very destructive. They have received their name from their habits; \(\varrho \ll \alpha\), a root, and \(\varkappa \tau \varepsilon \nu \omega\), to destroy. They are very nearly related to the subterraneous Sclerotia. R. crocorum grows parasitically on the roots of the cultivated Saffron, Crocus sativus, in France, and is so pernicious as to have acquired the name of la mort du safran. It is very destructive, soon causing the bulb to perish, and spreading with great rapidity over a whole field of that valuable crop, if not speedily stopped by a trench fifteen to eighteen inches deep, to cut off the communication between the infected and the sound plants. The smallest quantity of earth from an infected field is said to be capable of communicating this plague, even if the ground were not planted with saffron till twenty years afterwards. "Hitherto this de. structive parasite has not been heard of but in France. The plants are of an irregular knobbed figure, from half an inch to an inch long, of a light reddish brown, scarcely bursting; granular and paler within. Long branching capillary roots are sent out in all directions, propagating the plants very extensively and readily by offsets which attach themselves to the saffron, and multiplying in the substance of the bulbs soon destroy them." (Smith.)
2446. Periola. From re \(\xi\), about, and \(10 \lambda, 0\), hairiness, in allusion to the appearance the species exhibit when growing upon the roots of plants, or decaying fungi.

16309 Gregarious roundish but very irregular tuberculose orange-yellow within and without or whitish 16310 Depressed epiphyllous scattered or very confluent reddish fulvous
16311 Minute on both sides of the leaf numerous dark mostly angular and subconfluent

and Miscellaneous Particulars.
2007. Acinula. Very similar to Sclerotium or Periola; but distinguished by the diffluent coat, containing nucleus resembling an acinus in a berry, whence the name. A. Clavus is the Ergot of corn
2408. Erysibe. A Greek name of mildew. Most of the productions arranged under this head are known by the popular name of mildew. They are better characterized by the plants on which they grow, than by heir peculiar differences, which, it is probable, depend very much upon the former circumstance.
2409. Phallus. Large terrestrial fungi, sometimes growing upon rotten wood, not clustered, appearing in the summer after thunderstorms, fetid, and highly poisonous. Their form is so similar to that of the goe入入os of the Greeks, as not to be overlooked.
2410. Batarrea. So named by Persoon, in honor of Antonio Batarra, professor of botany in the Lyceum at Rimini, and author of a Historia Fungorum Agri Ariminensis, published at Faenza, in 1759, in quarto, with forty plates. A very curious plant found only in England, where, however, it is exceeding rare. The volva or wrapper is about the size of a hen's egg, originally of three slightly coriaceous layers, hollow internally, when a spongy stalk is formed which rises suddenly to its full height of about twelve inches. This stalk carries up on its summit full half the innermost layer of the volva, which is white and smooth within, and covered externally with copious brown sporules intermixed with fibres.

History, Use, Propagation, Culture,
cookery. Dogs are taught to find this fungus by the smell, and to scratch it up out of the earth. An instance is recorded of a man having possessed this power. It is brought to table either simply boiled, or stewed in various forms. It is reported to have a stimulating aphrodisiacal quality, which perhaps renders them more popular than their flavor, which is trifling. Truffles are found under the surface of the ground in various parts of Europe, where the soil is light and dry; as well as in Japan and the East Indies. There are said to le numerous varieties of color.
2412. Rhizopogon. Large or middle-sized Fungi, emerging from the earth, and resembling potatoes; scarcely eatable; but, according to Gleditsch, possessing aphrodisiacal qualities. On the outside covered with netted corymbose rooting fibres, whence the name, from \(\dot{\rho} i\langle\alpha\), a root, and \(\tau \omega y \omega \nu\), a beard,
2413. Nidularit. A diminution of nidus, a nest. The plants consist of a leathery cup containing several lenticular bodies supposed to contain sporules, and all together resembling a bird's-nest with eggs.
2414. Myriococcum. From \(\mu\) vesos, a thousand, and zoฆzos, a little capsule. Related to Sclerotium. The only species consists of superficial deformed confluent tubercles, 2-4-lines broad, at first sight resembling a white compound Sphæria with prominent brown orifices.
2415. Polyangium. Named by Link, from тoגvs, many, and ayyov, a capsule. Easily distinguished from the last by the internal grumous substance, which Nees and Fries consider unequal sporidia.
2416. Atvactobolus. From \(\alpha \tau \varrho \alpha e r \tau 05\), a spindle, and \(\beta \propto \lambda \lambda \omega\), to cast. The bladder which contains the sporules, is fusiform and closed, and is ejected from the base of the cupule as soon as the operculum is thrown oft:
2417. Thelebolus. From 9 in \(\lambda\), a nipple, and \(\beta \propto \lambda \lambda \omega\), to emit. The uterus protrudes a glubose papilliform vesicle. This is found on the dung of swine, after rainy weather in June and July. Tode compares it to the

and Miscellaneous Particulars.
roe of a fish in appearance, and to poppy-seed in size. The color is a tawny yellow. Each individual is globular, attached at the bottom by capillary roots, and crowned by a small papillary tubercle of a more orange or golden hue than the rest.
2418. Pilobolus. Named from \(\pi \lambda \lambda, 05\), a cap, and \(\beta \propto \lambda \lambda \omega\). A very natural genus, consisting of gregarious little fungi, of a very fugacious nature, inhabiting dung, appearing in the summer and autumn ; when full grown they resemble species of Mucor, but in a younger state they are more evidently interwoven, and resemble Sphæria or Sclerotium.
2419. Spharobolus. From \(\sigma \phi \alpha s c\), a glohe, and \(\beta \alpha \lambda \lambda \omega\). The peridium is double, membranous inside, at length becoming elastically inverted, and emitting a globose solid sporangium, filled with sporidia clustered in the centre. Epiphytous persistent plants, generally appearing in the autumn. S. stellatus is found in various parts of Europe in autumn upon rotten wood or branches of trees, heaps of sawdust, or in the tan-pits of hothouses In an early state each plant consists of a pale yellow globe larger than a mustard seed. Several such grow crowded in patches, bound down as it were by a fine cottony web, After a while each plant bursts into several starry rays, and by a momentary explosion, projects to the distance of six or eight inches a whitish globular mass of powdery seeds from its internal cavity. Sometimes this ball of seeds remains sticking to the points of the rays. When fallen to a distance, the skin of this ball is found empty, the seeds having flown out, in its passage, through a hole in its base. (Smith.)
2420. Xylaria. From \(\xi_{0} \lambda_{0}, y_{\text {, }}\) wood, in allusion to their station, or to their woody and durable texture. Once included in Sphæria.

History, Use, Propagation, Culture,
2421. Stromatospheria. From sewex, a layer or bed, and \(\sigma \varphi \in i \rho a\), a globe, in allusion to the imbedded character of the species. Apparently well divided by Dr. Greville from Sphæria.
2422. Cucurbitaria. So named in reference to the form of the sporules, which resemble little flasks. Sphæria

16560 Large black somewhat hemispherical, Surface smooth, Orifices of the spherules scarcely at all raised within composed of regular concentric strata
16361 Large pale and carnose at length brownish-black and rigid spreading thick undulato-rugose: the surface dotted with raised points
16362 Brown hemispher, depress, somew, conflu. when crowd. interior of same col. Spher, very slightly promin.
16363 Black thickish undulato-rugose whitish within, Mouths of the spherules round and somewhat prominent 16364 Black gregarious forming linear or oblong striæ smooth, Spherules very minute without obvious mouths 16365 Black irregular mostly free but sometimes bursting through the bark spreading confluent thickish-green within, Mouths of the spherules obtuse granulated prominent
10366 Globose purplish-red shining black within, Spherules in circumference with more or less promin. orifices

> * Receptacle bursting through barth.
a. Orifices of the spherules plane, or slightly prominent.

16367 Black plane spread, transversely on branch. smooth : inside whitish, Mouths of spherules not prominent 16368 Black plane spreading longitudinally white within, Mouths of the spherules somewhat prominent conical 16369 Black plane widely sprearding somewhat rugose at first subdistinct at length confluent and united by a kind of irregular crust, Mouths of the spherules conical and angular
16370 Grey.-black scattered plano-conv. round. parasitic on elm leaves, Surface papill. with mouths of spherules 16371 Scattered distinct very gregarious round elevated plane dark-brown dotted with the orifices of the spherules, Orifices nearly plane
16372 Scatter, broadly thin, Perithecia immers. scatter. cover. with a dark membran. crust, Orifices burst. forth 16373 Scattered gregarious rather large elliptical rusty-brown smooth minutely pulverulent blackish and friable within, Mouths of the sj,
16374 Short of a determinate figure emerging dark, Perithecia somewhat ovate, Orifices oltuse-unequal
16375 Rather small roundish elliptical dull-black bursting transversely through the bark depressed rugososulcate, Surface minutely rough with the mouths of the spherules
16376 Innate-immersed effused smooth black, Perithecia ovate immersed, Orifices prominent somew. depressed 16377 Gregar. distinct bursting through the bark which is marked with a narrow black ring, Disk small covered by an evanescent membr. ben. white pulverul. dott. with the black orifices of the immersed spherules
16378 Thickish purplish-brown black within covered with a min. pulverul. substance, Spher. conceal. Spor. oval
b. Orifices of the spherules more or less spinous.

16379 Scattered very gregarious somewhat conical roundish : the disk pulverulent white, Orifices of the spherules somewhat prominent and converging
16380 Deep black bursting transversely through the bark oblong elevated, Orifices of the spherules crowded level-topped acutely 4 -sided and grooved
16381 Black round much elevated very gregarious : the orifices thick irregular 4-sided
16382 Black gregarious sometimes subconfluent bursting transversely through the bark ferruginous within, Orifices of spherules erect straight cylindrical spinose
16383 Receptacle very small black, Spherules few crowded with thickish cylindrical elongated obtuse coarctate orifices umbilicate at their apex and piercing the bark
16384 Black ellipt_obl. burst. longitudin. through the bark, Spher, seat. on recept, crowd, rugose somew. tessellat. 16385 Clustered, Spherules globose dotted red at length black at first immersed in the receptacle, Tubes containing the sporules attenuated at each extremity
16386 Very gregarious, Spherules minute clustered scarlet oval irregular in size smooth : the mouth papilliform 16387 Duli pale-red scattered or crowded on the receptacle, Spherules globose tubereulated and rugose
16388 Black, Stroma very long, Perithecia at first immersed at length sessile crowded globose, Orifice papilliform with a circular depression around it
* Spherules collected into circular clusters.

16389 Black, Spherules few : the mouths elongated rough converging
16390 Black spherules aggregated forming a dense circle, Mouths filiform flexuose converging depressed 16391 Innate grow. on both sides, Leaf arrayed in round spots flat black, Perith. convex promin. becom. bossed ** Spherules more or less scallerch, or simply aggregated. a. Spherulcs with an orifice.

16392 Spherules few aggregated globose black: the orifice suberect filiform shining style-like
16393 Gregar. burst. forth, Perithecia glob. nearly separate fine black becom. ragged and cup-shap. Orifice simp. 16394 Black shining very numerous ovate conical : the mouth short thick cylindrical piercing the epidermis like a black point, After the decay of the epidermis the spherules are naked
16395 Scattered, Perithecia prominent convex smooth black, Orifice open white
16396 Spherules black minute very numerous globose white within immersed in the substance of the bark: the mouth very short scarcely piereing the epidermis which seems covered with innumerable dots
16397 Upon leaves, Perithecia imnate prominent punctiform globose black clustered in unequal spots 16398 Minute scattered, Spherules depressed : the mouth very short not exserted, Epidermis of the leaf convex and slightly ruptured, Sporules naked extremely minute

and Miscellaneous Particulars.
Cucurbitula of Tode, seems to have afforded the type of the genus, which contains most of the species constituting the seventh section of Sphæria in Persoon's system.
2423. Cryptospharia. A genus formed by Dr. Greville, to include those plants formerly refered to Spharia,

History, Use, Propagation, Culture,
which are destitute of a receptacle and remain concealed (xeurros, hidden, whence the name) beneath the epidermis of vegetables, which is only perforated by their mouths. They are further characterized by having their spherules not enclused in filiform tubes as in true Spharia.

16399 Black roundish oblong scattered bursting through the epidermis; Orifice irregular papillose [minute 16400 Scatter, rather min, plano-convex black. splitt. Epider. in centre and becom. umbilicat. Spor, naked very
16401 Scattered, Perithecia immersed globose black concealed, Orifices dilated naked hemispherical
16402 Scattered black shining plane : the margin slightly raised; the epidermis united with the plant and bursting at the centre into 3.5 acute segments, Sporules naked oblong in 3.5 distinct masses
16403 Gregarious often crowded, Spherules yellowish globose somewhat fleshy, Orifices short cylindrical surrounded by an orange web
t6404 Somew. innate parallel conflu. shin. black burst, with paral. slits, Thallus black, Perith in rows connate
16405 Scattered, Perithecia immersed globose, Orifices min. convex peeping out of a black spot becom. bosied
16406 Gregarious, Perithecia somewhat immersed ovate black, Oritice bursting conical acute
16407 Gregarious, Perithecia covered ovate black, Orifices bursting equal smooth longer
16408 Scattered under the epidermis which is very convex and ruptured in the centre, Mouth very short obtuse not exserted, Sporules oval in filiform tubes
16409 Scattered globose with a very short rounded umbilicated mouth : at first the mouth only visible at length the spherule itself semi-exserted falling out in decay and leaving a cavity
16410 Spherules minute scattered very numerous black round depress, Orifice papilliform piercing the epidermis like minute dots at length naked when it decays
16411 Spherules excessively minute scattered forming dark greyish cloud-like longitudinal spots on the smooth stalks of plants : the oritice somewhat acute penetrating the epidernis
b. Spherules without an evident orifice.

16412 Parasitic on the leaves of dead grasses scattered brown black white within flat hemispherical: the apex furnished with a tuft of black rigid diverging hairs
16413 Scattered or in small groups minute blackish roundish producing pale spots on the leaf
16414 Scattered very gregarious fructiform somewhat shining rarely dehiscent
16415 Excessively minute very gregarious so as to form dark cloud-like irregular spots on the leaf 16416 Spherules very numerous punctiform glaucous or blueish-black rendering the leaf pale
16417 Bursting forth lin. black with hardly any thallus, Perithecia in 1 or 2 rows somew. connate black inside
16418 Gregar. conflu. cover, with a blackened epider. Perith. deform. black: disk finally burst. forth and opaque
16419 Forming nearly equidistant spots upon the stems of large dead herbaceous plants, Very common
* Spherules with an orifice, not hairy.

16420 Black globose nearly smooth crowded : the orifice minute slightly papilliform
16421 Fine red min. smooth gregar. glob. with a very min. papill. orifice, Spher. at length collapsed and concave 16422 Black scattered gregarious roundish ovate acute shining: the mouth papilliform
16423 Subgregar. or scattered sessile orange-colored smooth glob. destitute of orifice whit. and filament. at base
16424 Perithecia glob, subimmers. Orifices promin. convex furnish, with an effused filament. strat. of a yell. color
16425 Globose deformed brownish-black banded within with concentric layers, Perithecia oblong immersed
16426 Convex pulvinate fuscous whole-colored inside, Perithecia globose, Orifices bossed
16427 Effused thin flattened black, Perithecia subglobose prominent pimpled
16428 Dark, Layer diffused branched, Perithecia oblong smooth pimpled
16429 Eiliptical smooth black white inside, Perithecia immersed ovate without orifice
16430 Of a regular figure very flat contigu. dark extern. and internally, Perith. immers, ov. Orif. glob. promin. 16431 Orbic, conv, separ, Layer white, Perithecia min. Orifices numer. disengaged glob, and rostell, somew, rug. 16432 Pustular, Layer adhering to the bark and emerging, Disk palish, Orifices exserted oval and rostellate 16433 Perithecia subovate, Orifices long thickened at end united in an opaque disk bursting transversely
16434 Minute circinate, Perithecia about 6 ovate and converging, Orifices round somewhat tapering emerging 16435 Cæspitose growing to the surface, Perithecia stalked ovate acute smooth dark
16436 Gregarious soft, Perithecia globose smooth somew. pimpled orange-red becoming concave by collapsion
16437 Scattered soft very small, Perithecia ovate smooth pimpled crimson
16438 Dark, Perithecia thin globose smooth, Orifice papillæform
16439 Black shining, Perithecia globose rigid smooth, Orifice papillæform
16440 Sess. min. soft aggregated or scattered smooth blood-red, Perithecia subglob. collapsing, Orifice papilliform
** Spherules with an orifice, hairy.
16441 Rather large brownish-black shining globose with a papilliform orifice arising from a dense brown filannentous straturn which sometimes partly envelopes the sperules
16442 Gregarious somewhat clustered quite black, Spherules roundish ovate somewhat tuberculate with short rigid scattered hairs, Orifice obtuse
16443 Spherules minute crowded roundish: when young appearing like one mass of diverging brown hairs at length almost naked towards the apex and black, Orifice minute papilliform
16444 Black gregar, hemispher. minutely granulat. : the apex naked somew. shin.; the base hairy, Orif. papill. 16445 Gregar.very crowd. ov. somew. acum. orange, Orifice indist. but the spherules escape in a pulverul. form 16:46 Gregarious rose-colored, Spherules ovato-globose subacute or papillose placed on a paler colored web

16428
16434
and Miscellaneous Particulars.

History, Use, Propagation, Culture,
cult of determination. Most of them are highly curious objects when minutely examined, and some even beautiful. Sphæria militaris is a fine species, about an inch in height, the head being ovate, of a beautiful scarlet, granulated like orange-peel.
2426. Lophium. So named from \(\lambda\) opos, a little elevation. Differs from Sphæria in being completely evolved, dehiscent, compressed, without a veil, and having a nucleus crumbling to powder. The plants are very similar to the valves of a bivalved shell.
2427. Sphceroncma. From \(\sigma \phi \alpha<\rho x\), a sphere, and youиa, gelatine, in allusion to the round mucous bag in which the sporules are enclosed. The species are minute innate plants, generally growing on wood, very permanent, and often cohering by their base.
2428. Septaria. Growing upon dead leaves, in the form of clouds or spots. Named upon account of the septa of the sporidia.
2429. Cytispora. From zuTヶ5, a little chest, and \(\sigma \pi \omega_{2} \alpha\), a sporule. The species are very common, growing upon plants, immersed, soft, bearing fruit during damp weather, and even by watering only, within doors. The most essential character consists not in the cirrhi, common to many fungi, but in the deformed cellular perithecia, by which it may be easily known in any state.

16447 Perithecia somew. ov. rather wart. black cover. with strigose hairs of same col. Orifice rather lengthened \(\beta\) Perithecia numerous seated on a little strigose villous crustaceous stalk
*** Spherules without an evident orifice.
16448 Gregarious obovate deep-black smooth tuberculated
16449 Spher. minute solitary or somew. cluster. black ovate setoso-rugose mouthless, Spor. ovate in cylindr. tubes 16450 Minute black scattered globose very rugose and tuberculated parasitic on the pileus of Polyporus abietinus 16451 Scatter. Perith. ellipt. rounded depress. plaited lengthwise opaque black, Orifice hidden somew. compress. 16452 Spher, black min. very numer, crowded roundish somew, tuberculated and often with a transverse furrow 16453 Emerging prominent irregular brownish-black rufous brown internally, Orifices concealed
16454 Tufted innate on the surface, Perithecia subglobose solid without orifice at first villous afterwards naked 16455 Naked more or less crowd. ovate-glob. black shining, Perith. very small smooth at first without an orifice 16456 Minute black scattered globose very warty, Parasitic on the cap of Polyporus abietinus
16457 Perithecia subglobose ovate tuberculate black covered with scattered hairs of the same color
16458 Stipit. compress. black transverse. striat. dilat. gradual. from stipes into an elongat. wedge-shap. peritheci, 16459 Somewhat stalked dilated upwards striated across shining

\section*{Division II. Cytisporei.}

16460 Perithecia conico-subulate acute yellowish somewhat pellucid, Globule very pale
16461 Spherules aggregated, Sporidia 3 or 4 times divided, Cirrhi often becoming effused
16462 Cells impressed on the receptacle, Disk emerging blackish, Cirrhi yellow
[with a cottony margin 16463 Sporulifer. tendr. white simp. Spher. waved: when divid. horizontal. manifest under epider. Orifice black.

16464 One or many-celled convex brownish-black somewhat umbonate in the centre
16465 Generally many-celled roundish flat brownish-testaceous, Orifices obsolete

\section*{Division III. Phacidiacei.}

16466 Long, surrounding the culms whitish becoming dark-yellow at length rendered granular by the orifices
16467 Epiphyll, xound, conflu. convex cinereous-black : internally black with white cells, Orifices like granulat. 16468 Epiphyllous subgregarious hemispherical smooth shining very black white within
16469 On both sides of the leaf regularly scattered roundish black shining collapsed rugose and plaited
16470 Plane orange-red, Sporules unequal globose
16471 Plane pale fulvous
16472 Epiphyllous somewhat angular and irregular in form subconfluent tuberculose black shining black within : the cellules white
16473 Minute innate on the surface rugose plaited opening with many flexuose cracks
16474 Orbicul, subhemispher, depressed black dehiscent in numer, acute segm. Disk pale greenish or yellowish 16475 Four-sided small black or whitish spots on the leaf splitting in \(4-5\) acute segments, Disk dingy

16476 Subimmersed crowded parallel linear black, Lips of the orifice tumid smooth, Disk linear 16477 Collected on pale defined spots roundish elliptical black: the margin depressed and paler

and Miscellaneous Particulars.
2450. Phoma. Said by its author to be named in allusion to the pustular appearance of the plants, whicb are of a brownish color, and grow within the substance of leaves.
2431. Dothidea. A genus which has been named from סo. \(10 y\), a tubercle, and sidos, similar, and appears to be very distinct. The species are numerous, growing upon plants; many of them are innate and dark, a few colored.
2432. Rhytisma. From puris, a wrinkle. R. corrugatum, the Lichen graniformis of English botany, is a gregarious, subcorneous, shining flattish plant, referred to Lichens by Acharius, but considered by Fries and Ehrenberg to belong to Fungi. It is common upon the crusts of Lichens and upon dry wood.
2483. Phacidium. A name with the same meaning as Dothidea; from \(\varphi \propto z t 5\), and \(\varepsilon\). \(\delta 05\). Intermediate between Rhytisma and Hysterium, but differing from both in the manner of dehiscence. The species are somewhat innate, epiphytous, tolerably permanent, blackish, and with a kernel which becomes softish.
2434. Hysterium. From \(\dot{v}^{5} \varepsilon \varepsilon^{2} r a s\), penury, in allusion, perhaps, to the diseased and squalid appearance which trees attacked by this fungus assume. Minute plants, resembling Opegrapha, and like that genus, found occupying the bark of trees; but destitute of a crust.

History, Use, Propagation, Culturc,
2435. Actinuthyrium. So called from axtuv, a ray, and gugow, to enclose, in allusion to the radiated integument of the sporidia. The only known species is innate, growing upon plants, orbicular, almost black, and appearing in the early part of the year.

243i. Leptostroma. From \(\lambda_{\varepsilon \pi \tau \pi o s, ~ t h i n ~ o r ~ d e l i c a t e, ~ a n d ~ s \rho \omega \mu \propto, ~ a ~ l a y e r, ~ i n ~ a l l u s i o n ~ t o ~ t h e ~ d i s k, ~ w h i c h, ~ w h e n ~}^{\text {, }}\) the perithecium separates, becomes naked and very thin.
2437. Xyloma. From छ̌ioy, wood, and \(\lambda \omega \mu \infty\), a margin. The species are innate coated tubercles, of a hard vesicular substance, but which does not produce fructification. One of the most common kinds, \(\mathbf{X}\). acerinum, has a ragged border.
2438. Lasiobotrys. From \(\lambda \omega \sigma \sigma 0\), wool, and Boreus, a bunch. This plant originates beneath the epidermis of the leaf, during its green and living state. When mature, it is of a very black color, and regular circular form, from one to two lines in breadth, very slightly convex, the surface uniformly granulated, and the whole generally situated on a paler or colorless portion of the leaf. On the bursting or laceration of the epidermis of the leaf, which takes place in the centre, our plant is found to consist of a multitude of distinct perithecia of a roundish form, closely arranged side by side, destitute of orifice, and the summits of which produce a granulated appearance to the naked eye or a small magnifier. These perithecia are fixed to the leaf by a number of short filaments radiating from their base, and are not to be detached without some

16503 Large gregarious subglobose yellowish-brown, Scales small numerous, Stipes subelongated incrassated below lacunose and variously divided at the root
16504 Globose subdepressed very firm smooth or warty sess, or with a very short thick stipes, Root scarcely any
16505 Middle-sized roundish long-rooted pale lemon-color obsoletely scaly, Scales thickish 16506 Gregarious smaller somewhat spotted smooth brown, Root hard fibrous

and Miscellaneous Particulars.
force. Their surface is smooth black. Within they are replete with a somewhat gelatinous granulose mass, containing subglobose sporidia. The above is a description of the usual appearance of this plant.

A variety, however, occurs in the form of a ring or annulus, the centre being unoccupied. Sometimes the perithecia are scattered in irregular groups, a few together, and may even occur solitary.
2439. Asteroma. So named by Decandolle; but we know not with what meaning. Many of the substances referred to this genus are believed to be merely young states of various kinds of Dothidea; some are the black lines by which certain Pyrenomycetes are bounded; others are merely darkened veins of leaves. To this the whole of Actinonema of Persoon, and several of his Capillarias are to be referred.
2440. Onygena. So called from ovy, a hoof, and reivouos, to be born, in allusion to the singular circumstance of the original and only species being always found on old horse-hoots in shady woody places.
2441. Tulostoma. From \(\tau \boldsymbol{\lambda} 0\), a wart, and \(\sigma \tau \sigma \alpha\), the mouth, in reference to the nature of the orifice by which the seeds of this plant are dispersed, T. brumale is found on the mossy tops of walls about London in the winter and spring. It may easily be overlooked for some unexpanded Agaric.
2442. Scleroderma. So called from \(\sigma \% \lambda m o s\), hard. and \(\delta\) sepex, skin, in allusion to the hardness of the coat of the specics. S. spadiceum is found on heaths in England, but is very rare; it is about the size of a chesnut, rather depressed at the top.

History, Use, Propagation, Culture,
2443. Tycoperdon. So called by Tournefort, from \(\lambda v z a s\), a wolf, and \(\pi \varepsilon \delta \omega\), to explode backwards, that author certainly having improved upon the foolish old name, Crepitus Jupi, by making it less generally intelligible. (Smith.) These are roundish tuber-like plants, when ripe, exploding and emitting the sporules in the form of smoke, whence country people call the species puffiballs.
2444. Bovista. A name of barbarous origin, having been formed by Dillenius, from the German Bofist. Bovista furfuracea, an Italian species, is said by Micheli, to be common on heaths near Florence, where it is sold with others of its tribe, as an article of food. Bovista gigantea is the largest of the genus, and, indeed, of the whole order, measuring not unfrequently nearly 2 feet in diameter. Bulliard mentions having seen many of eighteen, twenty, and twenty-three inches in diameter, and on the authority of others, affirms them to attain the enormous bulk of nearly nine feet in circumference. The flesh is at first white, afterwards of a greenish-yellow, lastly of a brown-grey. The outer peridium cracks and peels offin large flakes on being handled.
2445. Geastrum. So called from 275 , the earth, and \(\alpha 5 \eta 3\), a star, in allusion to the stellate appearance of the species when burst and lying on the ground. A genus formed by Micheli upon the Puff-balls with a stellated volva.
2446. Craterium. So naw.ed from ze๙тŋן, a cup, in allusion to the form of the peridium, which in C. vulgare is formed like a small goblet. This is a minute subsolitary plant, with the habit of Calicium.

16507 Large obconical soft whitish plicate beneath, Scales broad often indistinct
16508 White soft hemispherical subsessile somewhat smooth, Warts scattered
16509 Large white variable, Peridium subglob. cover. with spinul. warts, Stipes somew. smooth long and plicate
16510 Cæspit. pyrif. umbon. pale-brown, Scales in form of min. slender spin. process. Root consist. of long fibres
16511 Large white becoming blackish-brown plicate beneath
16512 Almost sessile very large globular yellowish-white, with scattered nearly obsolete scales
16513 Volva multifid, Peduncles and oscula of the peridium numerous
16514 Smaller, Head flat above, Orifice acuminate with longer ciliæ
16515 Peridium globose stalked, Orifice hoary, Radii somewhat quadrifid arched
16516 Volva multifid spreading, Laciniæ equal, Head depressed spherical sessile, Orifice acuminate

\section*{Division 11. Trichocisti.}

16517 Cup-shap. redd.-brown, Operculum convex whit, very thin evanescent, Filam. white, Sporules very dark 16518 Campanulate chesnut-color, Operculum firm white, Stipes orange, Sporules blackish

16519 Crowded cylindrical, Stipes black arising from a shining subjacent membrane, Peridia very fugacious blackish-brown, Stipes continued to the summit of the peridium 16520 Dark-brown globose stipitate, Stipes penetrating through the summit of the peridium

16530 Sessile subglobose smooth greyish-white: both of the peridia fragile, Sporules globular
16531 Head globose flattish beneath grey inclined, Stipes rather long pale weak sulcate, Sporules dark-brown 16532 Head glob, flatt, ben, blueish-grey nodd. Stipes thin weak whit. not furrow. Spor, and filam, dark-brown 1 15533 Head globose dark-grey, Stipes long firm black, Sporules and filaments very dark
16534 Subglob, umbilicate ben. yellowish-green, Stipes slender rather weak brown. Sporules and filam. very dark 16535 Head globose depressed pale-glaucous, Stipes very short thick pale at length brownish
16536 Peridium subglobose fine yellow, Stipes slender rather long greyish-brown, Sporules globose

\section*{and Miscellaneous Particulars.}
2447. Stemonitis. From snuw, a stamen, in allusion to the form of some of the species, which may be compared to the male organ of a flower, taking the stipes for the filament, and the head for the anthera.
2448. Cribraria. A genus formed by Schrader out of the Sphærocarpi of Bulliard. It has for its essential character, a peridium, the upper part of which has numerous apertures, whence the name, from cribro, to perforate. All the species are found in autumn upon rotten wood.
2449. Dictydium. From \(\delta_{i=\tau v o y, ~ a ~ n e t, ~ a n d ~}^{\varepsilon i \delta} 0\), similar; the peridium appears like net-work fastened together by minute delicate ribs. Very minute pinheaded plants, with the appearance of Calicium.
2450. Arscyria. From a̧zus, a net. The sporules are fastened together by a net-work of fibres. Beautiful little minute fungi, found upon wood.
2451. Leangium. From \(\lambda \in 105\), smooth, and arybos, a vessel, in reference to the smoothness of the peridium. Small wart-like plants, resembling a minute lycoperdon.
2452. Trichia. From 9 g \(\quad\) retxos, hair, in allusion to the internal mass of elastic fibres gradually expanding after the head bursts. These are pin-headed plants, growing upon old wood, and very rarely seen in this country.
2453. Diderma. From \(\delta \leqslant s\), double, and \(\delta \varepsilon \rho \mu x\), a skin, on account of the double peridium.

2454 . Physarum. So named, on account of the bladdery appearance of the peridium, from puon, a vesicle.

\section*{Class 1. Cephalotrichi.}
2465. CERA'TIUM. Albertini. CERatium. \(S p .1\)-?.

History, Use, Propagation, Culture,
2455. Leocarpus. A word with the same meaning as Leangium; which see. L. vernicosus appears as is varnished over with vermilion. The plants grow in clusters upon bits of rotten wood, and are each formed of a pear-shaped stalked peridium, bursting at the end, and letting fall out a nucleus of sporules held together by fibres.
2456. Lycogala. From \(\lambda v z o 5\), a wolf, and raiac, milk, a genus of fungi whose internal appearance and substance in an early state are like a mass of thick cream. It is included under Mucor by Linnæus, Schreber, and others. L. argenteum is found upon rotten wood in the autumn. It is about an inch or more in diameter, brown and pulpy when young, of a brilliant white when arrived at maturity, discharging, by one or more irregular accidental openings, a mass of rich dark snuff-colored powder.
2457. Spumaria. From spuma, froth. S. mucilago is spread in the autumn over the leaves and stems of living plants, or over dead branches, when it resembles in some measure stiffened foam or froth.
2458. Dichosporium. From \(\delta\) r \(\chi \propto\), double, and \(\sigma \pi 00 \infty\), a seed; in allusion, we presume, to the double coat of the peridium, the innermost of which is formed of granules like sporules. The only species known is found upon the bark of the oak.
2159. Licca. The meaning of this word is unexplained. The species have been referred to Trichia, Didy.

16637 Shortly stipitate obovate reddish-brown shining crowded, Stipes whitish

\section*{Division 1I1. Fuliginoidei.}

16538 Globular gregarious red changing to brown, Sporules orange-red at length purple-grey
16539 Large suboval very fragile silvery-white, Sporules profuse deep-brown, Filaments few
16540 Minute white roundish depressed rarely confluent fragile, Sporules black intermixed with a few filaments
16541 Effused frothy, Peridium furnished internally with horn-like grey processes melosing brown sporules

Division IV. Liceoidei.
16542 The only species

16543 Gregarious sessile yellowish or chesnut-brown subglobose : the upper half of the peridium separating like a lid, Sporules rarely mixed with one or two filaments
16544 Peridia cylindrical very fragile densely crowded forming a roundish or hemispherical mass dull-red changing to pale-brown, Sporules brown in the form of minute abundant dust

\section*{Class IV. Mucoroieer.}

16545 Byssus-like white becoming yellowish, Stipes erect or lax simple bearing a minute subglobose head

16546 Filaments branched whorled, Peridium elevated
16547 Stipes simple, Heads inflated spherical dark-grey bursting close to the stipes which is long and filiform

\section*{Class V. Ferisporia.}

16548 Gregarious punctiform yellow, Filaments whitish branched 16549 Tufted, Peridia gregar. greenish covered by the filam. which are elongat. simple profuse somew. erect in
[centre
16550 Changes from yellow to grey

\section*{HYPHOMYCETES.}

Class I. Cephalotrichit
16552 Growing in small tufts, Filaments subconfluent simple or branched and fasciculated

and Miscellancous Parliculars.
mium, \&c, by various writers. They are minute productions scarcel) bigger than pins' heads, found chiefly on rotten wood of the fir kind.
24i0. Mucor. An alteration of \(\mu v z n s\), the name of a small fungus. To this genus are referable the greater part of the substances which form the mould upon cheese and other materials.
2461. Thamnidium. From Gopyos, a rod or twig, in allusion to the appearance of the plants under the microscope. Minute plants, with a bushy branched stipes, and a head like that of Mucor.
2462. Ascophora. From \(\alpha \sigma z 05\), a term used by mycologists to denote a peculiar kind of receptacle of sporules, and \(\varphi ; \rho \omega\), to bear. These are pin-headed fungi, with the habit of Mucor, from which they chiefly difter in their peridium being turned inside out after bursting, and being somewhat persistent.
2463. Eurotium, Eusws was the Greek name of a sort of mouldiness, and has been with a sufficient reason applied to this genus of plants.
2464. Amphisporium. From acøt, double, and oroeq, a sporule. These organs are oitwo forms, either roundish with three dots in the middle, or ovate acuminate, and quite pellucid.
2465. Ceratium. So named from \(x \in \rho \alpha\), a horm, on account of the cormute appearance of the plants under a microscope.

History, Use, Propagation, Culture,
2466. Isaria. From toos, equal, on account, perhaps, of the equality which exists among the filaments of the plants both in size and length.
2467. Stilbum. From \(5 / \lambda \beta 05\), shining. The species are all found upon old rotten wood, and are at first watery or gelatinous, but become opake and turbid as they ripen.
2468. Torula. A diminutive of thorus or torus, a bed. This plant forms a thick compact bed or layer upon the plants on which it grows.
2469. Monilia. From monile, a necklace, with reference to the peculiar manner in which the filaments are articulated.
2470. Racodium. Passov was the name among the Greeks for a worthless worn-out ragged garment; and has been applied to the present genus, in allusion to the dirty interwoven cloth-like substance with which it clothes whatever it grows upon. R cellare is the black substance which overruns the bottles of the wine merchant, and which often hangs in long thick festoons from the sides and roof of his cellars.
2471. Dematium. A diminutive of \(\delta_{\varepsilon \mu \kappa,}\) a bundle or parcel. The filamentous thallus is often collected into bundles.
2472. Cladosporium. From «入 \(\alpha \delta o 5\), a branch, because the sporules are attached to the branches of the fungi.
2473. Helicosporium. From helix, a spiral, in allusion to the manner in which the sporules are curved.

16552 Extremely minute scattered simple club-shaped very white, Filaments and sporidia indistinct

\section*{Class II. Stilboider.}

16553 Head roundish whitish semifluid becoming firmer and yellowish, Stipes rather thick cylindrical

Class III. Inomycetes. - Division I. Byssacei.
16554 Filaments densely crowded so as to form a black crust
16555 Tufted gold color
16556 Very soft lax much interwoven of a greenish black color, Filaments intermixed with irregular granules

16557 Minute blackish fascicled, Bristles diverging sometimes jointed
16558 Tufted extremely minute of an olive-green color becoming blackish and rigid in old age
16559 Very minute spreading on old wood in wide velvety patches greenish-black, Filaments simple or branched jointed somewhat thickened upwards

16560 The only species

16561 Very irregular rigid diverging : when young from a common centre; afterwards straggling, Filaments tawny orange-color compressed of various sizes
16562 Compressed brown or black shining anastomising often broad and very extensive [regularly patent 16563 Stem pale redd. cylind. subfex. never anastomis. Branches spread. in all directions free, Fructific. clavate 16564 Stems covered with a mealy substance
16565 Long branched roundish somewhat separate black
16566 Round much branched snow-white, cellular and yellow inside

\section*{Division II. Mucedines.}

16567 Spreading widely within putrefying Agarici and Boleti, Filam, white, Spor. profuse bright orange-yellow
16568 Filaments spreading branched olive-brown, Pedicels of the sporules numerous alternate
16569 Forming a pulverulent hoariness interspersed with very minute tufts, Filaments few branched straggling, Sporules large obtusely oval
16570 Tufts roundish minute very white, Filaments loosely entangled, Sporules very numerous oval
16511 Tufts yellow irregular roundish, Filaments lax entangled, Sporules numerous subglobose
16572 Tufts of a reddish orange-color, Filaments very slender much entangled, Sporules glob. extremely minute 16573 Differs from the last, chiefly in its paler color
16574 Very white forming a web, Filarn. densely interwoven very fine, Sporules globular scattered very minute

and Miscelleneous Particulars.
2474. Oxonium. We presume, from ǒos, a branch, in allusion to the manncr in which the filaments branch or diverge from a common centre. This genus has been extracted from Dematium by Link
2475. Rhizomorpha. So called from its resemblance to the branching fibrous roots of various plants. All the productions referred to this genus are very obscure and uncertain. R. phosphorea, the Clavaria phosphorea of Sowerby, is a plant sometimes existing as a parasite between the wood and bark of trees, or in wine-cellars among saw-dust, and is, when fresh, remarkably luminous in the dark.
2476. Sepedonium. From \(\sigma \eta \pi \in \delta \omega y\), putrescence. The species grow among the decaying parts of fungi, and other putrid substances.
2477. Acremonium. From az¢б \(\mu \omega y\), a branch; the thecæ are produced about the filaments in fascicles, as branches are about trees.
2478. Sporotrichum. From \(\sigma\) жoga, and \(9 \rho 6\), hair, in allusion to the filamentous nature of the sporules. A very destructive parasite in some seasons, and probably of general distribution, for it has been detected on a great variety of plants. To gardeners it is well known as a kind of mildew or blight, and is commonly taken for an insect. The leaves of the peach-trees, even when protected by glass, are often attacked by it, nor does the fruit itself always escape, in which case it frequently drops off. The leaves are more or less distorted by it. As its production is probably the result of a peculiar state of the atmosphere, there is little chance of any means being discovered for its prevention.

Fistory, Use, Propagation, Culture,
2479. Trichothecium. The thecæ are intermixed among a mass of hair-like filaments; whence the name.
2480. Acrosporium. From azgos, the top of any thing, and aroga, a sporule; the latter occupying the summit of the simple filaments.
2481. Botyytis. So called from \(\beta\) orgus, a bunch of grapes, in allusion to the clusters of little globular seeds or seed vessels.
2482. Aspergillus. This is the name of the brush with which the holy-water is scattered in Catholic ceremonies, The little plant, consisting of a stem and a cluster of sporules at the top, is not unlike a little brush with its handle.
2483. Stachylidium. From \(\sigma \pi \approx \chi y\), a spike, and siōs, similar. The sporules are dispersed in a sort of spiked manner on the filaments.

16575 Tufted, Tufts distinct at length sometimes confluent, Filam. white, Sporules pink very numerous oval
16576 Filaments simple forming white spots of one or two lines in length on the living leaves of grasses
16577 Filam. branched somew. fasciculated erect in spreading tufts white at first at length a fine glauc. color
16578 Very lax tuft. white branch. Branch. few long spread. set with short patent ramuli bear, round clust. of spor, 16579 Tufted confluent white, Filaments one line high, Branches divaricate, Sporules numerous ovate large 16580 Pale purpl,-grey spread. Filam. branch, towards summ t, Branch. divaric, short, Spor, large oval numerous 16581 Somewhat tufted lax white not much branched, Sporules roundish

16582 Tuft. min. formed of white erect filaments with little heads at first white but when mature of a glauc. color 16583 In dense tufts composed of whitish or yellowish suberect entangled filaments with yellowish heads 16584 Tufts rather dense, Filaments entangled suberect heads as well as the filaments greenish
16585 Filaments scattered gregarious about a line high supporting an elongated tuft of beaded sporidia
16586 Filaments branched erect remotely jointed scattered white, Sporules globular
16587 Barren filaments effused interwoven : fertile ones simple somewhat scattered, Heads of sp rules white 16588 Densely tufted spreading, Heads of sporules at length glaucous

16589 Tufted, Tufts roundish composed of snow-white interwoven filaments, Sporules profuse green at length giving the whole a green-color

\section*{Class IV. Phylleriacex.}

16590 Irregularly tufted or effused and confluent whitish at length reddish-brown, Peridia shortly branched, Branches thick bearing several round or ovate lobes
i6591 On the surface of the leaf bright gold-color effused sometimes spreading over the whole leaf, Peridia simple crowded club-shaped, Sporules evident excessively minute yellow
16592 Hypophyllous, so minute as scarcely to be raised above the surface of the leaf pale obscure purple widely effused, Peridia simple obtusely club-shaped
16593 On the under surface of the leaf depressed distinct or confluent pale becoming reddish-brown, Pridia club-shaped very rarely turbinate flaceid, the upper half often inclined
16594 Mostly on the under surface of the leaf scattered subeffused rich reddish-brown, Peridia compressed lin. somewhat lax with the apex club-shaped and often truncate
16595 Mostly on the under surface irregularly tufted whitish becoming ferruginous, Peridia linear cylindrical twisted with rounded summits
16596 Hypophyll. silky or toment, pale or quadrangular, Peridia erect cylindric. long and attenuated to a point 16597 On the under surface whitish-pink becoming subferruginous rarely in the form of spots or tufts but confuent at the margin of the leaf which is rolled inwards and conceals it, Peridia short
16598 Mostly on the upper surface unequally scattered confluent fine crimson, Peridia polymorphous turbinate club-shaped or capitate, the summit frequently truncate
16599 Mostly on the under surface whitish at length dark ferruginous often confluent, Peridia short pelymorphous sometimes turbinate but generally with two blunt horn-like patent summits

\section*{CONIOMYCETES.}

History, Use, Propagatzon, Culture,
2489. Fusarium. The sporules are remarkable for their regular fusiform figure.
2490. Fxosporium. So called by Link, from \(\varepsilon \xi\), on the outside, and \(\sigma \pi a s o s\), a sporule; on account of their external situation. Entire plant about one-third of a line in diameter, rarely larger, very gregarious, deep black, convex, bursting from beneath the epidermis, and appearing bristly under a pocket magnifier. Sporidia very crowded, elongated, obtuse at the apex, subopake, divided transversely about five times, fixed at the base upon a roundish dark-colored, solid receptacle, and there persistent.
2491. Fusidium. A name with the same meaning as Fusarium.
2492. Polythrincium. From rodus, many, and \(\Theta_{\rho}\langle\gamma \sigma 05\), a little division. To the naked eye, this little plant appears in the form of numerous minute black spots of unequal size. Under the microscope, these spots are each found to consist of a number of distinct little roundish tufts of filaments, nearly equidistant from one another, and becoming smaller towards the circumference. The filaments are densely crowded, semitransparent, gradually thiokening upwards, somewhat moniliform from the numerous articulations, erect, simple; the sporidia oval, two-celled, scattered among the filaments.
 substance flowing from the branches of trees.

\section*{16603 Minute roundish or oval subgelatinous, Sporules long slender slightly curved}

16604 Gregarious black minute convex, Sporidia elongated obtuse about 5 times transversely divided

\section*{Class II. Entophyte, - Division I, Stilbosporei.}

16605 Mass thin irregular of a whitish or grey color
16606 Mass irregular thin bright-yellow or greenish

\section*{16607 The only species}

16608 Heaps rather large, Sporidia extremely minute nearly equally 2-celled
16609 Black granulated irregularly ovate at length shapeless, Sporules ovate attenuated at each extremity 16610 Heaps small, Sporidia ovate unilocular
16611 Heaps roundish bursting through the bark, Sporules ovate obtuse 2-celled
16612 Black very crowded, Filaments linear-oblong 4 or 5 times divided
16613 Spherules depressed black immersed, Sporules large ovate escaping in the form of thick black tendrils 16614 Spherules very small grey black, Sporules excessively minute dust-like under a high magnifying power escaping in the form of long capillary entangled dull-orange tendrils
16615 Spherules waved when divided horizontally elevating the epidermis, Orifice blackish with a cottony margin, Sporules very minute forming a single short slightly tortuous whitish tendrils

\section*{Division II, Hypodermia.}

16616 The only species
16617 Hypophyllous scattered dark fuscous round very pulverulent sometimes confluent, Sporidia globose
16618 Aggregated deep-brown chiefly hypophyllous confuent, Sporidia oval sometimes with a very min. stipes 16619 Hypophyllous scattered becoming confluent reddish or purplish-brown, Sporidia globose greenish under a high power of the microscope
16620 Hypophyllous circular scattered rarely disposed in a circle round a pale-brown centre, Sporidia globular
16621 Hypophyllous scattered single or disposed in a circle round a central one light-brown, Sporidia globular subovoid and rarely furnished with a minute pedicel
16622 On both sides of leaf dark fuscous minute round scattered, Sporidia globular rarely with a minute pedicel 16623 Hypophyllous scattered sometimes subconfluent roundish light-brown girt by the remains of epidermis, Sporidia oviform sometimes furnished with a very short blunt pedicel
16624 On both surfaces of the leaf and opposite to each other scattered round light-brown girt with the remains of the epidermis, Sporidia globose
16625 On both surfaces of the leaf brown round minute often not bursting: the epidermis rarely disposed in a circle, Sporidia ovoid sometimes with minute pedicels
16626 Scattered round depressed light-brown girt with the remains of the epidermis, Sporidia rounded or suboval rarely with minute pedicels
16627 Hypophyllous pale yellowish-brown sometimes disposed in a circle round : a central one minute rarely confluent, Sporidia roundish or egg-shaped and rather hyaline
16628 Hypophyllous scattered or partially aggregated reddish-brown rounded somewhat prominent minute very unequal, Sporidia roundish or oval rarely pedicelled
16629 On both sides of the leaf scattered distinct oblong reddish-brown girt by the ruptured epidermis, Sporidia subglobose rarely subpedicelled

2494. Sporidermium. From orogos, a sporule, and \(\delta \varepsilon \rho \mu \prec \varepsilon\), a skin, or coat. A plant of a very simple structure, composed entirely of linear-oblong or club-shaped semi-opake bodies, closely arranged side by side, exactly of the same height, and transversely divided by three or four dissepiments. When viewed with the naked eye, it resembles an intensely black thin crust, creeping over the surface of Thelephora. Specimens from Captain Carmichael, as well as those found by Dr. Greville, occurred on Thelephora vulgaris.
2495. Namaspora. From wn \(\mu x\), a thread, and \(\sigma \pi \circ \rho \alpha\), a sporule. The species resemble distorted threads filled with minute sporules.
2496. Cyiindrosporium. In allusion to the cylindrical form of the sporules. Found on both surfaces of living cabbage leaves (Brassica oleracea). Frequent in May and June. A very extraordinary plant, forming minute speck-like heaps of an oblong shape, but otherwise very irregular, and projecting into little angles and processes. They are disposed in a concentric manner, are pure white, and change in decay to a dirty yellow. Sporules naked, very numerous, cylindrical, truncate at each extremity, pellucid.
2497. Uredo. An old Latin name, from uro, to burn or scorch, applied to those occasional discolorations of the surfaces of plants which were attributed to blasts or injuries of the atmosphere or heavenly bodies, and are

History, Use, Propagation, Culture,
called mildew or blight. All the species are obscure and require further examination. They are in the hands of Bauer, whose knowledge and pictorial powers cannot be better employed than in illustrating this obscure part of vegetation.

16630 Hypophyl. scatter. very min. rounded becom. contigu. but not confluent, Sporidia pyriform subpedicellate 16631 Hypophyl. very min. convex orbicular scattered becom. confuent, Sporidia very min. globul. transparent 16632 Hypophyl. pale ochrey-yell. distinct at first soon bursting becom, conflu. and very pulverul. Sporidia oval 16633 Hypophyllous bright orange-yellow prominent crowded generally forming circles and becoming very confluent, Sporidia very numerous obovate
16634 Hypophyllous orange-yellow oblong irregular becoming confluent, Sporidia numerous
16635 Hypophyllous depressed yellow oblong concentric becoming confluent, Sporidia nearly oval
16636 Chiefly hypophyllous golden-yellow scattered irregular convex becoming confluent, Sporidia subspherical 16637 Hypophyllous small scattered effused orange-yellow, Sporidia suboval sometimes with a minute pedicel
16638 Hypophyllous golden-yellow suborbicular becoming effused, Sporidia very numerous irregularly spherical
16639 Bright redish-orange broad pulverulent hypophyl. and on nerves and petioles, Sporidia numer. subglob.
16640 Epiphyllous much scattered rather large yellow thick elevated from the leaf and bursting in a gyrose manner, Sporidia subglobose
16641 Hypophyl. lin. obl. crowded arranged in a subparallel manner orange-yell. becom. pale, Sporidia spherical 16642 Hypophyllous and on the petioles and calyx oblong thickish sometimes partly disposed in a circular manner and subconfluent deep reddish-yellow, Sporidia spherical
16643 On both sides of the leaf and stem suborbicular prominent bright orange-yellow scattered, Sporidia oval or even oblong transparent
16644 Hypophyllous and on the calyces rather large oval with an indurated disk after the sporidia have escaped, Sporidia bright orange spherical and granular within
16645 Hypophyllous scattered round depressed rarely confluent, Sporidia yellowish-orange spherical surrounded by the remains of the ruptured epidermis
16646 Hypophyllous punctiform scattered or collected into small clusters golden-yellow scarcely bursting, Sporidia ovate or oblong somewhat transparent and granular within
16647 Hypophyll. golden-yell. scatter. distin. surround. by remains of ruptur. epidermis, Sporidia subglob. minute 16648 On both sides of the leaf oblong or lin. sometimes forming long lines yellow becoming reddish or brownish in decay, Sporidia globular or suboval
16649 Hypophyllous and on the petioles somewhat aggregated but generally following the course of the veins, bullated yellow bursting in the centre
16650 Chiefly hypophyllous very minute regular numerous convex late in bursting golden-yellow, Spcridia roundish oval or even oblong
16651 Chiefly hypophyllous very minute pale-yellow subrotund convex scattered or collected into clusters scarcely bursting, Sporidia suboval
16652 Hypophyll. depressed regular in form redd. orange scattered becoming partially conflu. Sporidia egg-shaped
16653 Hypophyllous depressed minute spreading somewhat aggregated subcontluent irregular in form of a deep orange or orange-red, Sporidia oval
16654, Hypophyllous scattered or crowded distinct convex roundish large compared with the following mostly closed pale becoming golden-yellow, Sporidia very long obtuse at each extremity
16655 Hypophyllous punctiform prominent or papilliform numerous tawny yellow mostly closed, Sporidia ovate
16656 Polymorphous of various forms sometimes disposed in a circular manner quite white frequently never bursting, Sporidia in great profusion globular
16657 Within the fruit and glumes of corn and various grasses spreading and in a short time filling the whole with a profuse black dust, which under the microscope consists of minute spherical sporules
16658 Attacking the fructification of Carices and forming a black compact slightly pulverulent mass composed of a pale solid nucleus surrounded by the naked sporidia which are small and globular
16659 Always inclosed within the grain and filling it with uniform dense fetid blackish-brown mass composed of very minute spherical sporidia
16660 Attack, anth. and ovary of the Caryophyllea, fine purp. Spori. very plentiful pulverul. min. and globul. 16661 Sporidia very min, purpl.-brown plentiful produc. within florets and often filling them with pulverul. mass

16662 Large oblong or conical much scattered pale-orange bursting with an rregular orifice, Sporidia excessively abundant bright-urange
16663 Hypophyllous numerous distinct, Sporidia very white toothed, Teeth beautifully rolled back brittle and vanishing, Sporidia pinkish-orange
16664 Hypophyllous and on the petioles scattered or subaggregated numerous, Peridia whitish split into many small deciduous teeth, Sporidia orange becoming obscure brown
16665 Hypophyllous and on the petioles scattered distinct, Peridia very white spht into a few comparatively large teeth, Sporidia yellowish-white, Surface of the leaf ulistered whitish
16666 Hypophyllous very numerous subsessile scattered or collected into little clusters, Peridia white split into subrevolute teeth, Sporidia fine orange
16667 Hypophyllous, Peridia distinct but decidedly clustered and crowded prominent becoming subelongated; the mouth with a few broad very delicate decidious teeth, Sporidia fine orange
16668 Hypophyllous and on the petioles irregularly clustered and deforming the parts on which it grows, Peridia somewhat indistinct round prominent and yellowish with a subentire orifice

and Miscellaneous Particulars,
2498. Ficidium. These plants are found upon the leaves of other vegetables, and one of them is known to agriculturists under the name of Red Gum. This species usually grows inside the glumes of the calyx, under the epidermis, which, when the plant is ripe, bursts and emits a powder of a bright orange color. It does not

\footnotetext{
History, Use, Propagation, \({ }^{\text {C Culture, }}\)
}
appear to be materially injurious to the grain, if at all. Ears full of it have been found with very plump grains ; and it has also been found upon branded ears. Before the cuticle which covers the fungus bursts, it has much the appearance of a pustule upon the human bodg.

16669 Hypophyllous at first prominent pustular soon becoming agglomerated very numerous, Peridia splitting into short brittle yellowish-white teeth, Sporidia pale-orange
16670 Hypophyllous in widely scattered agglomerated clusters but not very crowded, Peridia subsessile split into very white exceedingly brittle teeth, Sporidia pale
16571 Hypophyllous and on the petioles and stem, Yeridia campanulate agglomerated rarely single split into many short recurved teeth, Sporidia ochre-yellow numerous ovate
16672 Hypophyllous and on the petioles, Peridia in dense agglomerated clusters whitish split into revolute teeth, Sporidia yellowish : the leaf whitish around the clusters
16673 Hypophyllous upon a thickened portion of the leaf, which on the upper surface is of a fine red color with a yellow border, Peridia densely crowded splitting into yellowish-white teeth, Sporidia pale
16674 Hypophyllous, Peridia agglomerated in scattered clusters of various sizes whitish with a brittle dentated margin, Sporidia yellow
16675 Hypophyllous and on the petioles aggregated short somewhat campanuiate with numerous very minute marginal teeth, Sporidia bright-orange subglobose or oval
16676 Hypophyllous and on the fruitstalk, seed-vessel, calyx, and even petals, Peridia short or elongated cylindrical densely crowded fine orange, Sporidia yellow under the microscope
16677 Hypophyllous and on the petioles and young fruit, Peridia elongated agglomerated brown splitting to the base in capillary segments, Sporidia numerous light-brown
16078 Hypophyllous, Peridia 2-12 long cylindrical slightly curved yellowish-brown springing from an orangecolored thickened portion of the leaf, Sporidia numerous greyish becoming brown
16579 Hypophyllous marked on the upper surface of the leaf by a yellow or purplish spot, Pexidia partly immersed short splitting into white revolute teeth, Sporidia pink-orange
16680 Hypophyllous producing a crimson spot on the upper surface of the leaf, Peridia minute subimmersed splitting regularly into small revolute white teeth, Sporidia yellowish-white
16681 Hypophyllous marked by a pale spot on the upper surface of the leaf and a pale ring round the peridia, which are small not numerous splitting into small brittle yellowish-white teeth, Sporidia pale
16682 Hypophyllous somewhat clustered, Clusters of a roundish form, Peridia oblongo-cylindrical brightorange, Mouth paler and bursting irregularly
16683 Hypophyllous, Sporidia mucronated 5-7-celled with a white filiform stipes incrassated towards the base which is furnished with a yellow gland
16694 Hypophyllous deep-black tufted, Sporidia 4-celled obtuse mucronate, Stipes slender incrassated at the base 16685 Hypophyllous tufted of various sizes black rather lax scattered, Sporidia 7-9-celled somewhat attenuated mucronate with a slender stipes incrassated at the base
16686 Somewhat tufted scattered black, Sporidia cylindrical 3-4-celled obtuse never mucronated, Stipes filiform 16687 Round, or ov, obl. scatter. black somew. convex, Sporidia densely crowded obl. obt. firmly fix. by pedicels 16688 Hypophyl. deep pinkish-brown promin. consist. of a number of distinct aggregat. tufts, Sporidia obl. acute 16689 Hypophyllous small of various sizes few together and confluent pale-brown, Sporidia long somewhat waved much attenuated at each extremity with an elongated stipes
16690 Hypophyllous punctiform minutely tufted subrotund blackish-brown, Sporidia crowded obtusely eggshaped with a long flexuose filiform pedicel
16691 Chiefiy hypophyllous minute aggregated rendering the nerves and petioles swollen dark bluish-grey before bursting, Sporidia nearly black oval not contracted in the centre, Stipes short
16692. Hypophyllous and on the petioles conglomerated confluent brownish-grey before bursting, Sporidia nearly black obtuse scarcely contracted in the centre: the upper cell sometimes divided
16693 Hypophyllous round scattered nearly black, Sporidia of an obtuse irregular figure with a short filiform stipes somewhat incrassated at the base
16694 Hypophyllous minute round very crowded reddish-brown : upper cell of the sporidia thick globose; the lower one long and narrow, Stipes short
16695 On both sides of the leaf and on the stem in small nearly black scattered tufts surrounded by the remains of the ruptured epidermis, Sporidia oval the two cells nearly equal, Stipes very short
16696 Hypophyllous minute very dark scattered, Sporidia short with both cells obtuse and a short stipes
16697 Hypophyllous circular very variable in size blackish-brown scattered rarely confluent, Sporidia very obtuse with a subelongated stipes
16698 On both sides of the leaf in minute tufts nearly black circular bordered by the remains of the epidermis, Sporidia variable very obtuse rounded 2-celled both often subdivided, Stipes very short
16699 Hypophyllous blackish-brown irregular in figure girt by ferruginous remains of epidermis, Sporidia crowded obtuse divided but scarcely contracted in the middle, Stipes short
16700 Hppophyllous scattered closely over the whole surface small round brown depressed, Sporidia much contracted in the centre nearly resembling figure 8 : the upper cell largest
16701 Hypophyllous very thickly scattered and becoming contiguous but very rarely confluent minute at first and ferruginous after bursting, Sporidia short : upper cell obtuse, Stipes very short
16702 Hypophyllous dark-brown scattered or sub-confluent often concentric, Sporidia crowded pulverulent obtusely oval slightly contracted in the middle: the lower cell terminating in an abrupt and short stipes 16703 On the leaf and petiole crowded confluent, Sporidia dark-brown puiverulent : upper cell obtuse, Stipes somewhat lengthened

and Miscellaneous Pariiculars.
2109. Puccinia. A name of obscure meaning; possibly derived from \(\pi\) mes, closely packed, in allusion to the crowded manner in which the little plants are placed. P. gráminis is a plant too well known to the farmer under the name of blight. It attacks the stem and leaves of corn, at first having the appearance of orange.

\section*{History, Use, Propagation, Culture,}
coloured streaks, which afterwards assume a deep chocolate-brown colour. The little plants chiefly attack the parenchyma, immediately below the stomata with which the cuticle abounds. Each individual is so small, that any stoma on a straw will, according to Sir Joseph Banks, produce from twenty to forty fungi, and every one of them will, no doubt, produce at least one hundred reproductive particles; so that the progeny from a single stoma will be enough to infect a whole plant. The period of a generation is supposed not to exceed a week; and as the reproductive particles are exceedingly light, they are wafted aloft in the air, which is thus loaded with clouds of animated dust, ready upon the first favourable occasion to carry blight and disease into all the neighbourhood. The figures which illustrate this subject are copies of Mr. Bauer's illustrations of blight, published in 1805 by Sir Joseph Banks. a (preceding page), a piece of infected wheat stem, natural size; \(b\), a highly magnified longitudinal cutting of the same; \(c\) to \(n\), highly magnified representations of the Puccinia gráminis in various states; \(o\), a piece of the cuticle magnified, and showing the stomata; \(p\), a highly magnified transverse cutting of the straw; \(q\), a magnified representation of the outside of the straw ; \(r\), a very highly magnified representation of a part of the same.

The alarming state of the harvest of August 1804, from what is vulgarly called blight, induced Sir Joseph Banks to have some blighted stalks of wheat examined under a powerful microscope, and drawings made from them by Mr. Francis Bauer. These were published in a pamphlet in January 1805, the object of which, as we are informed in the advertisement, was to procure " actual observations on the origin and progress of the disease" from those "intelligent agriculturists, whose residence in the country enables them daily to examine, not only the progress of their crops, but the origin and advances also of all those obstacles which nature has opposed to the success of agricultural labours, as if to awaken the energies of reason, and to reward the farmer for the exertions of his intellectual faculties, by the satisfaction of surmounting them."

As we have here a space that would otherwise be unoccupied, we cannot do better than to fill it up by transcribing the whole of the pamphlet alluded to, there being still ample room for "actual observations" on that baneful disease.
"Botanists have long known that the blight in corn is occasioned by the growth of a minute parasitic fungus or mushroom on the leaves, stems, and glumes of the living plant. Felice Fontana published, in the year 1767, an elaborate account of this mischievous weed*, with microscopic figures which give a tolerable idea of its form; more modern botanists + have given figures both of corn and of grass affected by it, but have not used high magnifying powers in their researches.
" Agriculturists do not appear to have paid, on this head, sufficient attention to the discoveries of their fellow-labourers in the field of nature; for though scarcely any English writer of note on the subject of rural economy has failed to state his opinion of the origin of this evil, no one of them has yet attributed it to the real cause, unless Mr. Kirby's excellent papers on some diseases of corn, published in the Transactions of the Linnean Society, are considered as agricultural essays.
" On this account it has been deemed expedient to offer, to the consideration of farmers, engravings of this destructive plant, made from the drawings of the accurate and ingenious Mr. Bauer, botanical painter to His Majesty, accompanied with his explanation, from which it is presumed an attentive reader will be able to form a correct idea of the facts intended to be represented, and a just opinion whether or not they are, as is presumed to be the case, correct and satisfactory.
"In order, however, to render Mr. Bauer's explanation more easy to be understood, it is necessary to premise, that the striped appearance of the surface of a straw, which may be seen with a common magnifying glass, is caused by alternate longitudinal partitions of the bark, the one imperforate, and the other furmished with one or two rows of pores or mouths, shut in dry, open in wet weather, and well calculated to imbibe fluid whenever the straw is damp. Pores or mouths similar to these are placed by nature on the surface of the leaves, branches, and stems of all perfect plants, a provision intended, no doubt, to compensate, in some measure, the want of locomotion in vegetables. A plant cannot when thirsty go to the brook and drink, but it can open nnumerable orifices, for the reception of every degree of moisture which either falls in the shape of rain and of dew, or is separated from the mass of fluid always held in solution by the atmosphere; it seldom

16704 Hypophyllous deep brown solitary scattered or concentric and subconfluent, Sporidia rather slender with the lower cell attenuated into a short stipes
16705 Hypophyllous minute scattered sometimes confluent irregular in form nearly black, Sporidia short obtuse small with a short stipes
16706 Hypophyll, very min. scatter. deep-brown, Sporidia thick obt. variable in shape with lower cell fusiform 16707 Hypophyllous tufts circular depressed broad dark fuscous composed of many smaller ones confluent at the centre, Sporidia oblong with lower cell somewhat attenuated
16708 Hypophyllous purplish black scattered in tufts, Sporidia variable generally very obtuse two rarely Ş-celled frequently also divided perpendicularly, Stipes short
16709 Epiphyllous brown eventually black oval often confluent and forming long lines, Sporidia oblong with a white filiform stipes firmly fixed at its base
16710 Tufts dense oblong often confluent and forming long parallel lines changing from yellowish.brown to black, Sporidia elongated : the upper cell the shortest, Stipes filiform
16711 Epiphyllous minute scattered nearly black, Sporidia globose with a filiform slender stipes
16712 Scattered reddish-brown round very convex surrounded by the ruptured epidermis, Sporidia oblong 2-celled yellow with a long filiform stem

\section*{and Miscellaneous Particulars.}
happens in the driest season, that the night does not afford some refreshment of this kind, to restore the moisture that has been exhausted by the heats of the preceding day. By these pores, which exist also on the leaves and glumes, it is presumed that the seeds of the fungus gain admission, and at the bottom of the hollows to which they lead ( \(b p\) ) they germinate and push their minute roots, no doubt (though these have not yet been traced), into the cellular texture beyond the bark, where they draw their nourishment by intercepting the sap that was intended by nature for the nutriment of the grain; the corn, of course, becomes shrivelled in proportion as the fungi are more or less numerous on the plant; and as the kernel only is extracted from the grain, while the cortical part remains undiminished, the proportion of flour to bran, in blighted corn, is always reduced in the same degree as the corn is made light. Some corn of this year's crop will not yield a stone of flour from a sack of wheat; and it is not impossible, that in some cases the corn has been so completely robbed of its flour by the fungus, that if the proprietor should choose to incur the expense of thrashing and grinding it, bran would be the produce, with scarcely an atom of flour for each grain.

Every species of corn, properly so called, is subject to the blight; but it is observable tnat spring corn is less damaged by it than winter, and rye less than wheat, probably because it is ripe and cut down before the fungus has had time to increase in any large degree. Tull says, 'that white core, or bearded white, which has its straw like a rush full of pith, is less subject to blight than lammas white, which ripens a week later.' (See page 74.) The spring wheat of Lincolnshire was not in the least shrivelled this year, though the straw was in some degree infected: the millers allowed that it was the best sample brought to market. Barley was in some places considerably spotted, but as the whole of the stem of that grain is naturally enveloped in the hose or basis of the leaf, the fungus can in no case gain admittance to the straw; it is, however, to be observed, that barley rises from the flail lighter this year than was expected from the appearance of the crop when gathered in,
\({ }^{56}\) Though diligent enquiry was made during the last autumn, no information of importance relative to the origin or the progress of the blight could be obtained : this is not to be wondered at, for as no one of the persons applied to have any knowledge of the real cause of the malady, none of them could direct their curiosity in a proper channel. Now that its nature and cause have been explained, we may reasonably expect that a few years will produce an interesting collection of facts and observations, and we may hope that some progress will be made towards the very desirable attainment of either a preventive or a cure.
"It seems probable that the leaf is first infected in the spring, or early in the summer, before the corn shoots up into straw, and that the fungus is then of an orange colour ; after the straw has become yellow, the fungus assumes a deep chocolate brown: each individual is so small, that every pore on a straw will produce from twenty to forty fungi, as may be seen in the plates, and every one of these will, no doubt, produce at least one hundred seeds; if then, one of these seeds tillers out into the number of plants that appear at the bottom of a pore ( \(b p\) ), how incalculably large must the increase be! A few diseased plants scattered over a field must speedily infect a whole neighbourhood, for the seeds of fungi are not much heavier than air, as every one who has trod upon a ripe puff-ball must have observed, by seeing the dust, among which is its seed, rise up and float on before him.
"How long it is before this fungus arises at puberty and scatters its seed in the wind, can only be guessed at by the analogy of others; probably the period of a generation is short, possibly not more than a week in a hot season : if so, how frequently in the latter end of the summer must the air be loaded as it were with this animated dust, ready whenever a gentle breeze, accompanied with humidity, shall give the signal, to intrude itself into the pores of thousands of acres of corn. Providence, however, careful of the creatures it has created, has benevolently provided against the too extensive multiplication of any species of being; was it otherwise, the minute plants and animals, enemies against which man has the fewest means of defence, would increase to an inordinate extent. This, however, can in no case happen, unless many predisposing causes afford their combined assistance. But for this wise and beneficent provision, the plague of slugs, the plague of mice, the plagues of grubs, wireworms, chafers, and many other creatures whose power of multiplying is countless as the sands of the sea, would long before this time have driven mankind and all the larger animals from the face of the earth.
"Though all old persons who have concerned themselves in agriculture remember the blight in corn many years, yet some have supposed that of late years it has materially increased; this, however, does not seem to be the case. Tull, in his Horse-hoeing Husbandry, p. 74., tells us that the year \(1725^{\text {' w }}\) was year of blight, the like of which was never before heard of, and which he hopes may never happen again;' yet the average

\section*{History, Use, Propagation, Culture, and Miscellaneous Particulars.}
price of wheat in the year 1726, when the harvest of 1725 was at market, was only \(36 s, 4 d\)., and the average of the five years of which it makes the first, \(37 \mathrm{~s} .7 \mathrm{~d} .: 1797\) was also a year of great blight; the price of wheat, in 1798, was 49s. 1d., and the average of the five years, from 1795 to \(1799,68 s .5 d\).
"The climate of the British isles is not the only one that is liable to the blight in corn; it happens occasionally in every part of Europe, and probably in all countries where corn is grown. Italy is very subject to it, and the last harvest of Sicily has been materially hurt by it. Specimens received from the colony of New South Wales show that considerable mischief was done to the wheat crop there, in the year 1803, by a parasitic plant very similar to the English one.
\({ }^{6}\) It has been long admitted by farmers, though scarcely credited by botanists, that wheat in the neighbourhood of a barberry bush seldom escapes the blight. The village of Rollesby in Norfolk, where barberries abound and wheat seldom succeeds, is called by the opprobrious appellation of mildew Rollesby. Some observing men have of late attributed this very perplexing effect to the farina of the flowers of the barberry, which is in truth yellow, and resembles in some degree the appearance of the rust, or what is presumed to be the blight in its early state.
\({ }^{66}\) It is, however, notorious to all botanical observers, that the leaves of the barberry are very subject to the attack of a yellow parasitic fungus, larger, but not otherwise different from the rust in corn.
"Is it not more than possible, that the parasitic fungus of the barberry and that of wheat are one and the same species, and that the seed is transferred from the barberry to the corn? Mistletoe, the parasitic plant with which we are the best acquainted, delights most to grow on the apple and hawthorn, but it flourishes occasionally on trees widely differing in their nature from both of these: in the Home Park, at Windsor, mistletoe may be seen in abundance on the lime trees planted there in avenues. If this conjecture is well founded, another year will not pass without its being confirmed by the observations of inquisitive and sagacious farmers.
© It would be presumptuous to offer any remedy for a malady, the progress of which is so little understood; conjectures, however, founded on the origin here assigned to it, may be hazarded without offence.

It is believed, but not dogmatically asserted (because Fontana, the best writer on the subject, asserts that the yellow and dark coloured blight are different species of fungi), to begin early in the spring, and first to appear on the leaves of wheat in the form of rust, or orange-coloured powder; at this season, the fungus will, in all probability, require as many weeks for its progress from infancy to puberty as it does days during the heats of autumn; but a very few plants of wheat thus infected are quite sufficient, if the fungus is permitted to ripen its seed, to spread the malady over a field, or indeed, over a whole parish.
\({ }^{65}\) The chocolate-coloured blight is little observed till the corn is approaching very nearly to ripeness; it appears then in the field in spots, which increase very rapidly in size, and are in calm weather somewhat circular, as if the disease took its origin from a central position.
" May it not happen, then, that the fungus is brought into the field in a few stalks of infected straw uncorrupted among the mass of dung laid in the ground at the time of sowing ? It must be confessed, however, that the clover leys, on which no dung from the yard was used, were as much infected last autumn as the manure crops. The immense multiplication of the disease in the last season seems however to account for this; as the air was no doubt frequently charged with seed for miles together, and deposited it indiscriminately on all sorts of crops.
"It cannot, however, be an expensive precaution to search diligently in the spring for young plants of wheat infected with the disease, and carefully to extixpate them, as well as all grasses, for several are subject to this or a similar malady, which have the appearance of orange-coloured or black stripes on their leaves, or on their straw; and if experience shall prove that uncorrupted straw can carry the disease with it into the field, it will cost the farmer but little precaution to prevent any mixture of fresh straw from being carried out with his rotten dung to the field.
"In a year like the present, that offers so fair an opportunity, it will be useful to observe attentively whether cattle in the straw yard thrive better or worse on blighted or on healthy straw. That blighted straw, retaining on it the fungi that have robbed the corn of its flour, has in it more nutritious matter than clean straw which has yielded a crop of plump grain, cannot be doubted; the question is whether this nutriment m the form of fungi does or can be made to agree as well with the stomachs of the animals that consume it, as it would do in that of straw and corn.
"It cannot be improper in this place to remark, that although the seeds of wheat are rendered, by the exhausting power of the fungus, so lean and shrivelled that scarcely any flour fit for the manufacture of bread can be obtained by grinding them, these very seeds will, except, perhaps, in the very worst cases, answer the purpose of seed-corn as well as the fairest and plumpest sample that can be obtained, and in some respects better; for as a bushel of much blighted corn will contain one third at least more grains in number than a bushel of plump corn, three bushels of such corn will go as far in sowing land, as four bushels of large grain. Fighty grains of the most blasted wheat of the last year that could be obtained, were sown in pots in the hot-houses; of these, seventy-eight produced healthy plants, a loss of 10 per cent only.
"The use of the flour of corn in furthering the process of vegetation is to nourish the minute plant from the time of its developement till its roots are able to attract food from the manured earth ; for this purpose, one tenth of the contents of a grain of good wheat is more than sufficient. The quantity of flour in wheat has been increased by culture and management calculated to improve its qualities for the benefit of mankind, in the same proportion as the pulp of apples and pears has been increased, by the same means, above what is found on the wildings and crabs in the hedges.
"It is customary to set aside or purchase for seed-corn, the boldest and plumpest samples that can be obtained; that is, those that contain the most flour ; but this is unnecessary waste of human subsistence ; the smallest grains, such as are sifted out before the wheat is carried out to market, and either consumed in the farmer's family or given to his poultry, will be found by experience to answer the purpose of propagating the sort from whence they sprung as effectually as the largest.
"Every ear of wheat is composed of a number of cups placed alternately on each piece of the straw; the lower ones contain, according to circumstances, three or four grains, nearly equal in size, but towards the top of the ear, where the quantity of nutriment is diminished by the more ample supply of those cups that are nearer the root, the third or fourth grain in a cup is frequently defrauded of its proportion, and becomes shrivelled and small. These small grains which are rejected by the miller, because they do not contain flour enough for his purpose, have, nevertheless, an ample abundance for all purposes of vegetation, and as fully partake of the sap, 'or blood, as we should call it in animals,' of the kind which produced them, as the fairest and fullest grain that can be obtained from the bottoms of the lower cups, by the wasteful process of beating the sheaves."

\title{
ENCYCLOPEDIA OF PLANTS.
}

\section*{PART II.}

NATURAL ARRANGEMENT.

THE difficulties connected with the adoption of the natural system of plants are these, that the characters of many of the orders are at present imperfectly known, and that they depend upon a consideration of many points of structure which are not to be determined without much labor and a considerable degree of practical skill in the use of the microscope and the dissecting knife. But the facilities which the habit of viewing all natural bodies with reference to the relations they bear to other bodies, and not as insulated individuals merely possessing certain peculiarities by which they may be referred to some station in an artificial system, ultimately gives to the investigations of the naturalist, are so great, that difficulties of the nature just alluded to ought not to be suffered to influence the botanist in determining which line of study he will follow, whether that pointed out by Linnæus, or that traced by the hand of nature. By the artificial system of Linnæus, indeed, no great difficulty exists in determining the number of stamens or styles possessed by a given plant, or the nature of their combination, and from the knowledge so obtained, in referring them to their class and order in the Linnæan system. But when this step has been gained, what more has been acquired than the bare knowledge that the plant in question possesses a certain number of stamens and styles? No possible notion can be formed of the relation it bears to other plants of the same nature, of the qualities it probably possesses, or of the structure of those parts not under examination, the fruit for example; and, finally, if it were wished to convey an idea of the plant to a stranger, no means would be in the possession of the Linnæan botanist of doing so, except by stating that the plant belonged to Pentandria Monogynia for example, which is stating nothing. But what would be the condition of the student of the natural affinities of plants in a similar case? It is true he would be obliged to consult more characters than the two uninfuential ones of Linneus - it would be necessary to ascertain if his subject was Vascular or Cellular ; if Vascular, whether it was Monocotyledonous or Dicotyledonous; if Dicotyledonous, whether the leaves were opposite or
alternate, stipulate or exstipulate, whether the flowers were monopetalous, polypetalous, or apetalous, the nature and station of the stamens, the condition of the ovarium, and so on. But when he has ascertained thus much, only let it be remembered, for a moment, how much he has gained indirectly as well as directly. Perhaps he has discovered that his plant belongs to Rubiaceæ; he will then have learned that all vegetables with opposite entire stipulate leaves, and a monopetalous: superior corolla, are also Rubiaceous; if a fragment of the leaves and stem only of such a plant were afterwards submitted to him for examination, he would recognise its affinities, and remember that it was Rubiaceous, and being aware of that fact, he would be able safely to infer that its calyx and corolla would be of a particular nature, that if the roots afforded any color for dying, it would be red; that the medicinal properties of the bark, if any, would be tonic, astringent, and febrifugal, and that its seeds would be of the same nature as those of coffee, and finally, its geographical position would be tolerably certain to him.
The really important obstacle which exists in the way of acquiring this kind of knowledge, is undoubtedly the want of any introduction to the study of it, accompanied by the distribution and characters of the natural orders into which plants are divided. It is to be boped that English readers at least will not long have to regret this deficiency in their elementary works. In this place, it must suffice to point out the characters upon which the great divisions depend, under which the orders themselves are arranged; and it is to be hoped, that even this small aid will be found to smooth the way, and to remove some of the obstacles that at present are supposed to exist at the very threshold of the temple.

Plants considered with reference to their general structure, are separated into two grand divisions called Cellulares and Vasculares.
The Cellulares answer to the Linnæan Cryptogamia, and are also called Acotyledonous; the Vasculares answer to the rest of the Linnæan system, which is sometimes called Phanerogamia and Cotyledonous.

\(a\), Longitudinal section of a stem.
f, Crustaceous thallus of a lichen, with shields.
\(b\), Transverse section of a stem.
c, Stem of a moss, with leaves and theca, or seed-case.
e, Leafy thallus of a lichen, with shields.
\({ }_{h},{ }_{i}\), Fungi of the highest dignity.
\(k\), Conferva magnified.
Cellulares, Cryptogamous, or Acotyledonous plants are all, therefore, different terms denoting the same combination of vegetables. The first term is here adopted in preference to the others as expressing the most obvious character upon which the division depends, namely, the cellular, not vascular, structure of the plants composing it. Cellular plants are formed entirely of cellular tissue (fig. 1.), without woody fibre or spiral vessels; or in more familiar terms by having no veins in their leaves if foliaceous, and not forming wood; they also are destitute of perfect fowers. The lower tribes, such as Fungi and Algæ, are destitute of leaves, and in some points approach the animal kingdom so nearly as to be scarcely distinguishable. In the highest tribe, Ferns, apparent weins are formed in the leaves; but as they are imperfectly supplied with spiral vessels, they cannot be considered more than analogous to the veins of other plants. Ferns, however, hold the intermediate station between Cellulares and Vasculares, and are chiefly retained among the former on account of their perfect accordance in other respects. In the whole of Acotyledones, it is unnecessary to examine the seed for the purpose of determining whether it has one cotyledon, several cotyledons, or none, the structure of the perfect plant giving the most obvious and satisfactory evidence.

d, Vertical section of a vascular stem. n, Woody fibre.
n. Spiral vessel

\(3^{2}\)

o, Leaf of a dicotyledonous plant
\(p\) s. Leaf of a monocotlyedonoub plant.

Vabculares, Phenogamous, or Cotyledonous plants, are also separated into two great classes called Endogenes or Monocutyledones, and Exogenes or Dicotyledones, both which are distinguished as accurately by their obvious physical structure as they are by the minute and obscure peculiarities of the seed. They are all formed with cellular tissue, woody fibre, and spiral vessels (fig. 2.), and their leaves are traversed by veins; the last character is sufficient for practical purposes, if it is remembered that they also bear perfect flowers, (that is, flowers furnished either with stamina, or pistillum, or both,) which will always prevent their being confounded with the highest tribes of Cellulares.

q, Transverse section of a monocotyledonous stem.
\(r\), Germination of a monocotyledonous seed.
e, Germination of a monocotyledonous seed.
esta. Section of ditto, to show the cotyledon remaining in the
testa.
testa.
Endogenes, or Monocotyledonous plants, are the first remove from Cellulares, and hold an intermediate rank between them and Exogenes or Dicotyledonous plants, in which vegetation acquires its highest form of developement. They were fornerly characterised by having a single cotyledon, but this circumstance is not only not absolute but difficult of determination, except after minute analysis. The real difference in the seed of them and Dicotyledones is this, that in Monocotyledones there is only one Cotyledon (fig. 3, s) ; or, if two, that they are alternate with each other \((t)\), while in Dicotyledones they are always opposite, and more than one, sometimes several, as in Pinus (fig. 4. \(y\) ). The physiological structure of the two classes is, however, that by which they are familiarly distinguished, and exhibits a beautiful proof of the harmony that exists between the great features of vegetation and their first principle, the seed from which they originate. In Endogenes, or Monocotyledones, there is no distinction between wood and bark (fig. 3. q) ; in Exogenes, or Dicotyledones, the wood and bark are distinctly separated ( \(f i g .4, v\) ). In Monocotyledones the wood and cellular tissue are mixed together without any distinct annual layers of the former being evident; in Dicotyledones the wood and cellular tissue have each their particular limits assigned them, a distinct layer of the former being annually deposited. In Monocotyledones there are no radiations from the medulla to the bark; in Dicotyledones the radiations are distinctly marked. In Monocotyledones there is generally no articulation between the leaves and the stem, while in Dicotyledones the leaves are always jointed with the stem from which they fall off, leaving a scar behind. In Monocotyledones the veins of the leaf pass in parallel lines from the base to the apex, in Dicotyledones they diverge from the midrib towards the margin at various angles; in the former they are unbrancbed, the principal veins being connected by nearly simple secondary veins; in the latter they are much branched, ramifying in many directions, and giving the surface of the leaf a netted appearance.

\(v\), Transverse section of a dicotyledonous stem. \(v\), Transverse section of a dicotyledo
\(w\), An embryo with two cotyledons.
\(w\), An embryo with four cotyledons.

y, An embryo with many cotyledons.
\(z\), Stem and leaves of a dicotyledonous plant.

Such are the very obvious distinctions of the two great classes of Phænogamous, or flowering, plants; and so far is it from there being any necessity for dissecting a seed in order to ascertain its structure, that this point is one of the most easy determination, and about which there cannot be in one case in five hundred the slightest cause of doubt or difficulty. It is almost impossible to take even a morsel of a plant in the hand without instantly being in possession of the knowledge of the structure of its seed, with respect to the cotyledons.
Thus far have we advanced without a single obstacle to impede us. In all farther investigation no greater degree of knowledge or application is requisite than what ought to be possessed by every one who would be able to ascertain the genus of a plant. Many of the orders do not depend upon the minute characters of the seed so much as is believed; the structure of the ovarium and position of the ovula, are aids which frequently make amends for the absence of fruit: and the nature of the foliage and inflorescence are guides which, though sometimes treacherous, are often as faithful as the fructification itself. But as it is not intended to give the characters of the orders in this place, neither is it necessary to advance farther in an explanation of the manner of determining them; upon that point each order would require a particular note. It may, how-
ever, be confidently believed, that there are no greater impediments in the road to an acquaintance with the natural relations of plants than those that have been already removed; and that although neither the science of botany, nor any other science, is to be taken by storm, yet that the fortress is sure to be reduced by silent and patient approach.

It only remains to explain briefly upon what principles the names of the orders, suborders, \&c. are formed. It is usual, in the school of Jussieu, to give to a natural order a name derived from that of the genus which is understood to be the type of the order; as Ranunculaceæ from Randnculus, Rosaceæ from Rósa, and so on. But several deviations from this principle had been admitted by Jussieu, in favor of certain groups of plants, long known by other popular names, derived from certain peculiarities; such as Labiatæ, because their corollas are labiate; Compositæ, because their flowers are what is commonly called compound; Guttiferæ, on account of the resinous juice in which they abound, and some others. It would, perhaps, have been better, if uniformity in nomenclature had not thus been sacrificed to a dread of innovation; but it is now too late to remedy the evil, if such it be; nor would the advantage of alteration be at this day equivalent to the inconvenience. For the purpose of making it at once apparent, whether, in speaking of a group of plants, reference is had to an order or a suborder, it has of late years been thought convenient to terminate the name of the natural order in acea, and of the suborder in ea. Thus, in speaking of the whole mass of which Randnculus is the representative, the word Ranunculacece is used; but in speaking of the particular division, or suborder, of which Ranunculus forms a part, the term Ranunculece is employed. This manner of speaking is, however, at present, very partial in its application, and is of little importance, except in a few cases, of which Ranunculaceæ is one of the most striking examples. In those orders, the titles of which, necessarily, from their grammatical construction, end in ear, as Orchidea, it is obviously inapplicable, without a total change in a great part of the nomenclature of natural orders, a measure which cannot be too much deprecated.

It may, perhaps, be finally expected, that these remarks should be concluded by a recommendation of some work, from which those who are anxious to become fully acquainted with the principles and distinguishing characters of the Natural System of Botany, may derive the necessary information. Unfortunately, however, such a work has at present no existence. M. Decandolle's Théorie E'émentaire de la Botanique explains the principles upon which the orders of plants are constituted; and M. de Jussieu's Genera Plantarum contains their characters, as determined in 1789: but the latter is now too obsolete to be very useful to the tyro. In our own language, the only work that can be consulted upon the subject with advantage, is the Flora Scotica of Professor Hooker, in which the characters of the natural orders of Scottish plants are concisely indicated by Mr, Lindley. We understand a work upon the subject is in preparation by the latter gentleman, by which this great desideratum in the science of Botany will be supplied. It may be expected to appear in the course of 1829, previously to which, however, the division Botany, in the forthcoming Encyclopædia of Natural History will have been published, in which much information may be expected upon this important subject.

\section*{I. VASCULARES.}

\section*{Class I. Dicotyledones.}

\section*{Subdivision I. DICHLAMYDEE.}

This subdivision comprehends all the Dicotyledonous plants, that have both a calyx and corolla, by which they are distinguished from Monochlamydeæ, in which the calyx only exists. It is in consequence of this high developement of the floral envelopes, that the greater part of flowering trees and shrubs are found in Dichlamydeæ, it rarely happening that those with a single foral covering only have any brilliant coloring.

\section*{Subclass I. THALAMIFLORE.}

\section*{Petols inserted into the receptacle.}

The insertion of the petals and stamens into the receptacle is the great character of this subclass, which, therefore, contains all the polyandrous plants of Linnæus, as the Calyciforæ contain the icosandrous genera of the same botanist.

\section*{Section 1. Carpella numerous, or stamens opposite the petals.}

\section*{Order I. RANUNCULACEE.}

The greater part of the plants of this order are objects of interest with gardeners, containing, as it does, many of the most elegant or showy of the tribes of hardy plants. It is here that the graceful Clematis, the lowly Anemóne, the glittering Ranunculus, and the gaudy Pæony are found; differing, indeed, in external appearance, but combined by all the essential characters of the fructification. It is remarkable, however, that the acrid and venomous properties of these plants are nearly as powerful as their beauty is great. They are all caustic, and in many of them the deleterious principle is in dangerous abundance. M. Decandolle remarks, that its nature is extremely singular ; it is so volatile, that, in most cases, simple drying in the air or infusion in water is sufficient to destroy it : it is neither acid nor alkaline; but its activity is increased by acids, honey, sugar, wine, or alcohol; and it is, in reality, destructible only by water. The crowfoots of our European pastures, and the Anemónes trilobáta and triternáta, of those of South America, are well known poisons of cattle. Blistering plasters are made in Iceland of the leaves of Randuculus ácris. The foliage of some species of Clématis is supposed to afford the means employed by beggars of producing artificial ulcers. Some of the Aconites are diuretic, especially Napéllus and Cámmarum. Delphinium Consólida is said to be an ingredient in those French cosmetics which are so destructive of the surface of the skin. The Helléborus, famous in classical history for its drastic powers, and the Nigélla, celebrated in ancient housewifery for its aromatic seeds, which were used for pepper before that article was discovered, are both comprehended in Ranunculaceæ. The range of this order, in a geographical point of view, is very extensive. A great number has been discovered in Europe, but they are so abundant in all parts of the world that an order can scarcely be found more universally and equally dispersed. It is singular, that, with the exception of the climbing species of Clematis and of Xanthorhiza, scarcely an instance occurs in Ranunculaceæ of a shrubby stem.

\section*{Order II，DILLENIACE压。}

Fine plants，almost exclusively confined to tropical countries．Dillénia speciósa，a native of India，is a most noble tree with large yellow flowers，rivalling those of a Magnolia．Hibbertia volabilis is a green－house plant well known for the beauty of its blossoms，and their powerfully fetid smell．The medical properties of this order are scarcely known；a decoction of their leaves or bark is astringent，and used for gargles；and the acid juice of the fruit of some of the species of Dillénia is used in India，mixed with water，as a pleasant beverage in fevers．The foliage of many of the species is extremely scabrous，whence the dried leaves are used for the same purposes as fish－skin and sand－paper in Europe；those of Trachytélla áspera are even employed in China for polishing works of metal．
1201 Curatélla W．
1206 Trachytélla Dec．
1203 Hibbértia H．K
1212 Tetrácera \(L\) ．
1214 Dillénia W．
1211 Colbértia Sal．

Order ili．Magnoliaceet
No one is ignorant of the grandeur of Magnolias，or of the deticious，though sometimes dangerous，fragrance of their blossoms ；but it is less generally known，that，from their affinity to the trees that produce the famous Winter＇s bark and Melambo bark，they possess medicinal qualities of no common power．The bark of all of them is said to have a bitter flavor without any astringency，and combined with a hot aromatic principle．In the United States，the bark of Magnólia glaúca and Liriodendron tulipifera，is employed for the same purposes as Jesuit＇s bark，and from the fruit of Magnólia acumináta，a tincture is prepared which has some reputation for removing attacks of rbeumatism．The fruit of Hllicium anisatum，is the material which flavors the liqueur called Anisette de Bourdeaux．The Magnolias are exclusively inhabitants of Asia and America，no species having hitherto been found either in Europe or in Africa．

1215 Illicium \(W\) ．
1216 Liriodéndron \(W\) ．
1217 Magnólia W
1218 Michélia \(W\) ．

\section*{Order IV．ANNONACE庣，}

The plants of this order are closely allied to Magnoliaceæ，from which they are principally distinguished by the absence of stipulæ，and by the structure of their anthers and seeds．The latter consist of a hard mass of albumen，ruminated，as the botanists call it，that is to say，perforated by the substance of the seed－coat，in every direction．They are all trees or shrubs，and chiefly inhabitants of the hottest parts of the tropics，but a few have been discovered straggling into the temperate zones of America．The fruit of the Annóna is in many species highly esteemed as an article for the dessert，especially that of the Cherimoyer，which has the reputation of being the finest fruit in the world，next to the Mangosteen．The hard fruits of the species of Uvária are highly aromatic；those of one of them furnish the Piper æthiopicum of the shops．The genus Asiminai is the only one which contains any hardy species，and these are so delicate as to be seen very rarely in this country．In Brazil，the bark of Xylópia sericea is used for cordage；for which it is admirably adapted．

1219 Ưvária W．
1220 Annóna \(P\) ．S．

1221 Artabótrys R．Br．
1222 Guattéria R．\＆P．

1223 Asímina Ad．
1224 Xylópia \(W\) ．

\section*{Order V．MENISPERMEXA}

The order of Menispermeæ consists entirely of twining shrubs with minute flowers．They are ex－ tremely dissimilar in habit from the orders which are placed near them，and occupy their present station entirely on account of certain minute but important characters in their fructification．With the exception of Schizandra coccinea none of them are worth cultivating as plants of ornament．The berries of Lardizabála biternáta are sold in the markets of Chile，under the name of Aguilboquil，Guilbogui，or Coguill－Vochi，according to different travellers．The bitter，diuretic，and aperient sorts of Pareira brava，are produced by a species of Monispérmum，as is also the famous Columbo root，so much esteemed for its intense bitterness，and for its use in diarrhcea and dysentery．The poisonous drug，called Cocculus indicus in the shops，is the seed of Meni－ spérmum Cócculus．Several Brazilian species of Cócculus are said to possess powerful febrifugal properties． No species of Menispermeæ is found in Europe；they are chiefly natives of tropical America and Asia．

\end{array}
\]

\section*{Order VI．BERBERIDEE．}

With the exception of Bérberis this order does not contain any genus of much interest；most of the others are low，inconspicuous，herbaceous plants；Nandina is an elegant Japanese shrub．The Berberises are all shrubs of much beauty and interest，especially the species with pinnated leaves，which are sometimes called Mahonias．These are all inhabitants either of Europe，Asia，or North and South America；none have ever been seen in Africa or New South Wales．Many of the finest species from Chile and India yet remain to be introduced．The berries of the Berberises are acid and astringent ；the latter quality is especially abundant in the stem and bark．
\(\begin{array}{lll}297 \text { Epimédium } W . & 826 \text { Caulophýllum Mich．} & 829 \text { Bérberis } W . \\ 825 \text { Leóntice } W . & 827 \text { Diphylléia Mich．} & 830 \text { Nandína } W .\end{array}\)

\section*{Order VII．PODOPHYLLACEAE．}

Little interesting herbaceous North American plants，nearly related on the one hand to Nymphæaceæ，and， on the other，to the herbaceous genera of Berberideæ．Their juice is held to be purgative．

1166 Podophýllum \(W\) ．
896 Jeffersónia Ph．

\section*{Order VIII．HYDROPELTIDE A}

This order differs from Nymphæaceæ chiefly in having a definite number of seeds．It consists of only two genera，each containing a single species．Both are little floating plants of tropical and northern America． Nothing is known of their properties．

1240 Hydropéltis \(H\) ．\(K\) ．

\section*{Order IX．NYMPH 历ACE \(\boldsymbol{C}_{\text {，}}\)}

Like the last，these are all floating plants，and，to gardeners，possessed of great interest，on account of the elegant form and various hues of their flowers Three species are known as the lilies of our own streams and ponds，and the remainder occupy similar stations in other countries．Some of the Indian species of Nymphæ＇a are delightfully fragrant．The holy Cyamus，or Pythagorean bean of antiquity，is the produce of the Nelum－ bium，a stately aquatic，which abounds in all the hotter countries of the East，where its roots are frequently used as an article of food．The ditches，about Pekin and other Chinese cities，are literally choaked up with its abundance．The pericarpia or beans are oblong，hard，smooth bodies，and possess the power of vege－ tating after having been dried for even thirty years．The flowers and roots of the common white Nymphæ＇a have been long celebrated for their sedative and antiaphrodisiacal qualities，which are，however，now con－ sidered doubtful．In Sweden，in years of scarcity，the roots of Nuphar lutea are pounded into cakes along with the inner bark of Pinus sylvéstris．

This order has been the cause or much difference among botanists，as to its true station in a natural classifi－ cation，its structure being of so doubtful a character as to leave room for disputing whether it belongs to Dicotyledones or Monocotyledones．Upon this subject M．Decandolle has the following remarks ：＂Gærtner declares that the embryu is undivided，and therefore monocotyledonous．In 1802， 1 remarked in the Bulletin Philomathique，that the embryo both of Nymphe＇a and Núphar is enclosed in a peculiar integument，and that a dicotyledonous structure is apparent when that integument is removed；shortly after，M．Mirbel declared that the embryo of Nelambium has two thick cotyledones；in \(1806, \mathrm{M}\) ．Turpin gave an accurate description of the fruit of Nelambium lateum，without however removing the doubts about the real structure of the embryo，and two years afterwards his colleague，M．Poiteau，described the seed and germination of the same plant，pointing out that the embryo consisted of two thick cotyledons enclosed within a stipular membrane，but destitute of radicula：this was subsequently confirmed by M．Mirbel after very minute anatomical examin－ ation；that observer compared the seed of Nelumbium to the seed of Amygdalus，and also to that of Piper and Saururus，and also demonstrated that the structure of the stem was analogous to that of exogenous or dicotyledonous plants．A very different opinion was shortly afterwards held by M．Correa de Serra，an observer of the highest order，who admitted indeed that Nymphzaceæ are exogenous，but contended that the parts which had been taken by previous observers for cotyledons were，in fact，a mere expansion of the radicle， and that cotyledons were as entirely absent in Nelumbium as in Cascuta．In the meanwhile M．de Jussicu adhered to the old opinion，that Nymphæaceæ are monocotyledonous；in which he was supported by the late Professor Louis Claude Richard，a name for ever memorable in the annals of Carpology，who published a new view of their structure，in which be differed materially from all his predecessors；this botanist considered the stipulary membrane of Poiteau a simple cotyledon，and the cotyledons of that writer the hypoblastus，or body of the radicula；he also refused to admit any evidence derived from the anatomical structure of the stem．In this conflict of opinions，I have determined to station Nymphreaceæ among Exogenes，for the following reasons：1st，because the structure of their stem is that of Exogenes rather than of Endogenes；2dly，because the two opposite bodies，enclosed within the little bag or stipulary membrane，described by Poiteau，appear to be undoubtedly cotyledons，which is confirmed by the presence of a plumula between them in Nelumbium ； 3dly，because of the structure of their flower，which has a great affinity with that of Pæónia，Magnólia，and Papáver；4thly，on account of the similarity between their fruit and stigma and that of Papáver；5thly， because of their milky juice and convolute leaves，two characters which are not known to exist among Endo－ genes．＂Those who are interested in pursuing this curious discussion any farther，will find many remarks and iliustrative figures in the English edition of the Analyse du Fruit，published by Mr．Lindley in 1819.

Section 2．Carpalla solitary or connate；Placenta parietal．

\section*{Order X．PAPAVERACES．}

These plants are better known for their medicinal properties than for their beauty．Some of them are the common pests of corn fields，and with grain have been disseminated over all the world．Sanguinaria is a neat little American plant well known for its crimson juice，and the emetic purgative powers of its roots．Sara－ cénnia is a genus of very doubtful affinity ；consisting of curious little American marsh plants of difficult culture， and remarkable for the singular pitcher－like form of its leaves．The peculiar power of the poppy is，as is well known，narcotic；a property which pervades all the order，although in a less intense degree in all than in the officinal P．somniferum，from which exclusively the drug opium is obtained．The Mexicans use the expressed oil of the seeds of Argemóne mexicána for polishing furniture．

\section*{Order XI．FUMARIACE危。}

Tender herbs，with fineiy cut leaves and annual stems，abounding in a watery juice；without any appear－ ance of milkiness．They are reckoned slightly diaphoretic and aperient，but their medical properties are trifling．Formerly they were combined with Papaveraceæ，from which they are now universally distin－ guished．The greater part of them are natives of hedges or thickets in the cooler parts of the northern hemisphere ；two are natives of the Cape of Good Hope．Many of the species are beautiful ornaments of the flower－garden．

\section*{Order XII．CRUCIFERE。}

The importance of this order to mankind，and the singular nature of its botanical characters，render it expedient to speak very fully upon it：in which the remarks of the learned M．Decandolle，who has paid Crucifere particular attention，will be chiefly followed．The order consists wholly of annual or perernial， often biennial herbs，occasionally assuming a suffrutescent habit；then，however，never exceeding the height of three feet．The roots are either thick and perennial，or annual or biennial and slender，almost always per－ pendicular and undivided．The young roots are tipped with a little sheath，called the coleorhiza，which is produced by the extended ruptured coat of the epidermis when the rootlet first appears．This is a curious character，and deserves attention．The stems are round or somewhat angular，branched，and often，even in the annual species，indurated at the base．The branches proceed from the axillæ of the leaves，but the upper－ most ones are abortive in most cases．The race＊es are always opposite to the leaves；sometimes the terminal branch is abortive when the raceme appears to be terminal；but this is merely owing to that circumstance． The leaves are simple，generally radical or alternate，rarely opposite．The flowers are either white，yellow， or purple，or in a few Cape species bright blue．The fruit is called either a siliqua or silicula，the former being a linear pod containing many seeds，the latter a roundish pod containing one or very few seeds，whence this order，which is the same as the Linnæan class Tetradynamia，is divided by Linnæus into two parts，called Siliquoser and Siliculosæ．In the seed，the radicle and cotyledons are applied to each other in different ways， from which the suborders of M．Decandolle derive their characters．When the edge of the cotyledons is pressed close to the radicula，so that a cross section would be thus \(O=\) ，the cotyledons are said to be accum－ bent，as in all Pleurorhizeæ；when the side of the cotyledons is pressed to the radicula thus \(O\) II，the former are called incumbent，as in Notorhizeæ．If the cotyledons are incumbent，and at the same time half folded together or conduplicate，thus \(O \gg\) ，the suborder Orthoploceæ is formed；when the cotyledons are incumbent and spirally twisted，so that a section would resemble this \(O\)｜｜1｜，they constitute the suborder Spirolobeæ；and finally，when the cotyledons are incumbent，and doubled twice in their length，thus O｜｜\｜｜｜｜， we have Diplecolobeæ．
The whole order is preeminently European； 166 species are found in the north and middle of Europe，and 178 on the sea－shores of the Mediterranean； 45 are found between Mogadore and Alexandria； 184 in the countries of the East，that is to say，Syria，Asia Minor，Tauria，and Persia； 99 in Siberia； 35 in China，Japan， and India； 16 in New Holland and the South Sea islands； 6 in the Mauritius and adjacent countries； 70 at the Cape ； 9 in the Canaries； 2 in Saint Helena； 2 in the West Indies； 41 in South America； 48 in North America； 5 in Kamtchatka and the bordering islands；and finally， 35 are common to several parts of the globe．From this it appears that there are about 100 species in the southern hemisphere，and about 800 in the northern：or，if they are considered with reference to the zones of temperature， 205 are natives of the frigid zone of the northem hemisphere； 30 of the whole of the tropics； 548 of the temperate zone of the northern hemisphere；and 86 of t．e southern．The forty－first degree of north latitude may be considered the cqui－
torial line of Cruclferæ, about half being found on one side of it, and half on the other. Their station is very variable; many inhabit open sandy places, some form the vegetation about the limits of the perpetual snows of lofty mountains, and many follow the footsteps of man through all parts of the world.
The useful qualities of the turnip, the radish, the rape, and the cabbage, and its multiform varieties, are all well known. The greater part of the order consists of plants possessing high antiscorbutic powers. These appear to depend upon a certain acrid volatile oily principle, the chemical nature of which is imperfectly known. It is particularly abundant in the seeds of mustard and the roots of horseradish, and the leaves of Lepidium latifolium, which latter exercise a violent influence upon the organs of digestion. The same sort of acrimony, but in less degree, is found in the herbage of the scurvy-grass and the roots of the radish, which act much more mildly when taken inwardly; thus, when any cruciferous plants are found to be eatable, either from culture or other circumstances, it is to be understood to depend upon a reduction of this acrid principle. The exciting powers of this last, are what render the horse-radish, the scurvy grass, and others, so remarkably useful as antiscorbutics; they are also believed to possess diuretic and diaphoretic properties. It is to be remarked, that Cruciferx are always eatable when their texture is succulent and watery, as in the roots of the radish and the turnip, and the leaves of the cabbage tribe. A further diminution of the acrid principle is produced by blanching. Cruciferæ are said to possess a greater share of azote than any other tribe of plants; as is apparent in their fetid smell when fermented. The embryo of all the order abounds in oil, whence many species are employed with much advantage for expressing, either for eating or for feeding lamps. Some of the species are extremely beautiful and fragrant, as the Stocks, the Giliyfowers, the Hesperides, the Candytufts, and many others. The Hutchinsias, Drabas, Cardamines, \&c. are among the most interesting of alpine plants

\section*{Order XIII. FLACOURTIANEF.}

A very small order formerly comprised in Tiliaceæ. It is remarkable on account of the structure of its fruit, to the inner lining of which the seeds are attached upon a branched placenta. Nothing is known of the properties of the Flacourtias. The berries of Flacoúrtia Ramóntchi are eaten in Madagascar. The order consists entirely of small tropical trees or bushes.

2102 Flacourtia \(\boldsymbol{W}\).

\section*{Order XIV. CAPPARIDE}

These are nearly related to Crucifere, of the properties of which they partake. Many are very pretty plants, especially Cleóme rosea, and the various species of Cratæ'va. The common caper is an elegant bush, remarkable for its large white flowers and long purple stamens. The species are found occasionally in various parts of the world. The different kinds of Cápparis are reputed to be stimulating, antiscorbutic, and aperient. The bark of the root of the common caper passes for a diuretic medicine. Several species of Cleóme have an acrid taste, which has been compared by travellers to that of mustard. The root of Cleóme dodecandra is employed as a vermifuge in the United States; and the leaves produce an inflammation of the skin, whence they are used in Cochin-china as a sinapism. Dec.

1162 Cápparis \(W\). 1086 Cratæ/va \(W\).
1448 Cleóme \(W\).

\section*{Order XV. VIOLARIEA,}

This is one of the most favorite orders with gardeners ; consisting, as it chiefly does, of the Violet genus, from which most of the others are recent dismemberments. The greater part are hardy herbaceous plants, some of which are remarkable for their perfume, others for their brilliant colors, and all for their neatness. They are natives of the temperate or cold zones of both hemispheres, often growing at great elevations above the sea. Among them is a tribe called Alsodineæ, consisting of suffrutescent tropical plants; but none of them have been introduced into the gardens of this country. The attention of collectors should be directed to procuring the shrubby Violaceæ of Brazil, some of which possess great interest. The medical properties of the order are found principally in their roots, which appear to possess, in all cases, emetic properties, in a greater or less degree. One of the Ipecacuanhas is the root of a Brazilian violet. M. Decandolle has the following observations upon the affinities of the Violarieæ: - They are very nearly akin, he observes, to the Polygaleæ and Droseraceæ, and especially to the Passifloreæ. From the first they are distinguished by their unilocular fruit, leaves furnished with stipules and two-celled anthers; from Droseracea by their solitary style, lengthened embryo and stipulate leaves, the vernation of which is involutive, not circinate. From Passifloreæ they differ in their fruit being capsular, not berried; in their albumen being compact and shining, not pitted; in their stamens being hypogynous, not perigynous; in their anthers being attached along their whole length, not fixed by their middle; finally, in their stigmas being one and not three. The genus Calyptrion approaches Passifloreæ in its twining stem, and Hymenanthéra borders upon Polygaleæ on account of its monospermous pericarpium with solitary pendulous seeds.

541 Ionídium Vent.
540 Viola \(W\).
539 Sauvagésia Jacq.

\section*{Order XVI. POLYGALEE.}

Most of the plants of this order are interesting, and deserving the attention of the gardener, some for their neatness, some for their beauty, and some for their use in medicine. They are natives of most countries, and are either low herbaceous plants, occasionally less than an inch in height (small specimens of Polygala purpúrea), or shrubs varying from a dwarf, rigid, spiny habit, to a tall, graceful, drooping appearance. Polygaleæ are remarkable for the union of their stamens into a single body, their one-celled anthers opening with a pore, and their irregular flowers, one of which is often keel-shaped, and beautifully crested or bearded. The leaves have generally a bitter astringent taste, which is much more abundant in the roots, combined with an acrid and somewhat resinous flavour: these properties are particularly sensible in P. sénega, which is reputed a sudorific, diuretic, sialagogue, cathartic, or mild emetic, according to the manner in which it is administered. The Yelhoi of South America, the root of a species of Monnina, has the same properties as \(\mathbf{P}\). sénega, and is particularly used as a remedy for dysentery. The well known Rattany, or Ratanhia root, of Chile, is the produce of a plant of this order, and possesses powerful tonic and astringent qualities. According to the analysis of a French chemist, it contains gallic acid, but neither tannin nor resin.

1508 Polýgala W. 1509 Muráltia Necl\&. 1510 Múndia Kunth. 1511 Securidáca. L.
Order XVII. Droseracee.
The order of sun-dews is a small group of plants, natives of marshes or inundated grounds in all the temperate parts of the world. The species are very remarkable for the abundance of glandular hairs with which all the parts of the foliage are covered. Only two species are in any degree frutescent. The young leaves are always rolled up in the circinate manner, so remarkable in ferns. Their medicinal properties appear to be trifling: the leaves have the power of curdling milk.

702 Drósera W.
1009 Dionæ'a \(W\).
Order XVIII. BIXINEA.
The plants of this order are few in number, and not remarkable either for beauty or use. The Bixa orellána is chiefly knewn for producing the seed called in the shops Arnotta (Rocon, Fr.), and used for coloring cheese; the properties of the Arnotta are slightly purgative and stomachic. They are all bushes or small trees, and mostly tropical. Azaras, Chilian shrubs with fragrant fowers, are not yet known in the gardens of Europe.

1178 Bixa \(W\).
1179 Prockia L.

\section*{Order XIX. CISTINE压.}

The common rock roses of our gardens give an accurate idea of this order, which contains little clse. They are all very ornamental, and particularly well calculated for covering rockwork. The species of Cistus and Heliánthemum have been multiplied by Dunal in an extravagant manner, as has been well demonstrated by Mr. Bentham. They are natives of most parts of the world in dry elevated places. The gum called Ladanum is the produce of some kinds of Cistus; it exhales a fragrant perfume when burnt, and possesses slightly tonic and stomachic properties.

\section*{Section 3. Ovarium solitary. Placenta central.}

\section*{Order XX. CARYOPHYLLER}

These consist of herbs or low undershrubs, inhabiting the mountains and pastures of all parts of the world. In Europe and Siberia they are particularly abundant, and least so in Africa and South America. Many are common weeds, as most of the Cerástiums, Spérgulas, and others. Several of the Silénes are very ornamental, and among the Arenarias are to be found some dwarf species of considerable elegance. But it is in Diánthus that the pride of the order consists: this genus is almost unrivalled for the brilliancy of its colors, the neatness of its foliage, and the perfume of its flowers. From the finest of its species the title of the order has been derived. The virtues of Caryophylleæ are slight. Saponária officinális, and one or two others, bave been praised for possessing antisyphilitic properties; the root of Siléne virginiána is reputed anthelmintic ; and the Arenária peploides, being termented, is used by the Icelanders for food.

\section*{Order XXI. LINEF.}

Separated by M. Decandolle from Caryophylleæ, from which it is well distinguished by its fruit having several cells, or in the language of the botanist just named, being formed by the cohesion of several carpella. Most of the species are pretty plants, bearing yellow, blue, or white flowers. They are of immense importance in the world, on account of the tenacity of their fibres when made into flax. The seeds of common flax are between mucilaginous and oily; the leaves of Linum cathárticum and L. selaginoides, the latter a native of Peru, are purgative.

\section*{701 Linum \(W\)}

\section*{321 Radiola Sm}

\section*{Order XXII. FRANKENIACEEA.}

Distinguished from Caryophyllez by the fruit not having a central scparate placenta, but bearing the seeds on the inner margin of the valves. The species are natives of arid situations in Europe, Africa, and South America. They have not much beauty, and no known medical properties. Besides the genus here recorded, there are two others mentioned by M. Decandolle.

835 Frankénia \(W\).

\section*{Order XXIII, MALVACEe.}

Before this order was dismembered of Bombaceæ and Byttneriaceæ, it contained most of the grandest flowers in nature. Even now, the splendour of the various species of Malva, Althæ'a, to which the hollyhock belongs, and Hibiscus, renders it one of the most remarkable groups of plants. With the exception of the numerous genus Sida, nearly all Malvaceæ are objects worthy of the gardener's care, particularly those which are hardy. In stoves or greenhouse, the softness of their branches and leaves render them peculiarly liable to the attacks of the red spider, mealy bug, and scale, from which few collections are free; a circumstance which makes them less generally esteemed than the surpassing beauty of many of them merits. The greater part of the order is clothed with stellate pubescence, and a reniform one-celled anther is a character common to the whole. These two peculiarities, together with the alternate stipulate leaves, distinguish Malvacem fiom all the rest of Dichlamydeæ. All the species abound in a nutritive mucilage; a quality which renders the young heads of the Ochro, or Hibiscus esculéntus, an object of great value within the tropics, as an ingredient in soups. In Brazil, the Abátilon esculentum serves the same purposes. The emollient properties of Althr'a officinális, or Guimauve of the French, are well known to physicians, as a remedy for catarrhs and pulmonary complaints, A decoction of the leaves of Sphærálcea cisplatina is used for similar objects in Brazil. A species of Pavónia is employed in the same country as a diuretic in the form of a decoction. The straight shoots of Sida micrántha are employed as rocket-sticks at Rio Janeiro. The chewed leaves of Sída carpinifólia allay the inflammation occasioned by the stings of wasps. The tough fibres of many Malvaceæ are manufactured into cordage. Their petals are astringent; whence those of Hibiscus Rósa sinénsis are used in China to blacken the eyelashes and the leather of shoes. The fibrous threads in which the seeds of Gossypium are enveloped furnish the valuable cotton, an article of immense importance to the world; these threads when examined by the microscope, will be seen to be finely toothed, which explains the cause of their adhering together with greater facility than those of Bombax and several Apocineæ, which are destitute of teeth, and which cannot be spun into thread without an admixture of cotton.

1481 Gossýpium \(W\).

\section*{Order XXIV. BOMBACEE.}

Distinguished from the last by the imbricate æstivation of the calyx, and the arrangement of the stamens in five sets, or, in Linnæan language, brotherhoods. The species are mostly fine trees with large showy flowers, and natives of the tropics. Some of them are among the largest trees in the world; Adansónia, the Baobab of Senegal, has been seen with a diameter of twenty-five feet, and specimens of Bombax Ceiba, and Eriodéndron anfractuósum, are not uncommon an hundred feet in height. The wood of all the species is light and soft, as in Malvacex, from which this order probably does not differ in its medicinal properties.

1466 Helícteres \(W\). & 1491 Adansónia \(W\). & 1493 Myródia \(W\).
\end{tabular}

\section*{Onder XXV. BYTTNERIACEÆ}

Much the same kind of plants as those of the two last orders, from which they were not formerly distinguished; and from which they scarcely differ, except in their bilocular anthers. Many of the Sterculias are fine umbrageous trees, the seeds of which are large and eatable; especially those of the famous Kola, which possess the property, being chewed, of rendering bad water pleasant to the palate. The seeds of the Chicha, another and very noble species of the genus, are highly esteemed in Brazil for the dessert. Astrapæ' a, and several other genera related to it, are among the most beautiful in the world. The flowers of a species of Pentapétes, called by the Indians, Machucunha, give out a mucilaginous refrigerant juice, which is employed in gonorrhæa. Guazúma ulmifólia has its fruit filled with a pleasant mucilage, which is sweet and very agreeable; an extract of the bark of the same plant is used in Martinique to clarify sugar ; its old bark is
pmployed in the form of a strong decoction，as a sudorific．Walthéria Douradinha contains a great deat of mucilage，and is employed by the Brazilians as an antisyphilitic．

\section*{Order XXVI．TREMANDRE}

A very small order containing only seven species，all small bushes，natives of New Holland，and remarkable for the peculiar neatness of their appearance．In habit，they may be compared to heaths，with which they agree in the anthers bursting by a pore at the end．Nothing is known of their properties．

\section*{879 Tetrathéca Sm ．}

\section*{Order XXVII．TILIACE压}

Trees，shrubs，or herbs，in general not remarkable for their beauty，the greater part of the last being the commonest weeds of the tropics．The Lime，from which the order derives its name，is a genus of fine trees with fragrant fowers，and Sparmánnia and Enteléa are handsome broad－leaved greenhouse arborescent plants．The inner bark of Tilia is tough and separable，and supplies the material whence the Russia mats used by gardeners and others are prepared．Córchorus olitórius is cultivated in Egypt as a kitchen－garden vegetable；the fibres of the bark of Córchorus capsularis are twisted into fishing lines；and the roasted nuts of the Lime tree are reported to bear some resemblance to chocolate．

1182 Sparmánnia W． 1185 Gréwia W．
1187 Córchorus \(W\) ．
1180 Slónea \(W\) ．
1183 Enteléa R．Br．

\section*{Order XXVIII．ELeocarpex．}

These differ from Tiliaceæ in nothing except their lobed petals and anthers opening by two pores at the apex．The flowers of some of the species of Elæocarpus are fragrant，the fruit eatable，and the hard rugose stones manufactured into necklaces．

1192 Elæocárpus \(\boldsymbol{W}\) ．

\section*{Order XXIX．SAPINDACE无．}

One of the distinctive peculiarities of this order consists in the petals having an auditional lobe in the inside，or a tuft of hairs instead．Nearly all the plants have compound leaves，and bunches of white flowers； a few of them are twining herbs，but the greater part are trees or shrubs，ali natives of the warmer parts of the world，and in a great proportion，of the East．The only genus which will bear the climate of England is Kolreutéria，a fine shrub or small tree，with panicles of white or pale yellow flowers．Nephélium and Dimocárpus are both genera bearing excellent fruit．The rind of the berry of Sapindus saponária is of a soapy quality，as the name of the plant indicates．The pulp of Melicócca，the arillus of Blighia sápida，and the kernel of Berthollétea and Pékea are all excellent eating．

831 Cossignia Juss．
886 Metáiba Aubl．
924 Seriána W．

\section*{Order XXX，HIPPOCASTANETE．}

The only genus is \(\mathrm{E}^{\prime}\)＇sculus，from which some botanists have divided the smooth－fruited species under the name of Pavia．The order is much valued for the grandeur of the foliage and flowers of most of the species， which are all hardy trees．Their bitter fruit has sometimes been used as a sternutatory ；it contains a large quantity of potash，and an abundance of starch．The bark is astringent，bitter，and febrifugal，and has been recommended as a substitute for Cinchóna．
\[
866 \mathrm{E}^{\prime} \text { sculus } W
\]

\section*{Order XXXI．HIPPOCRATICEE．}

Little is known of this order．The species are tropical arborescent or climbing shrubs，with opposite simple leaves，and small inconspicuous flowers．The genus Tonsélla，of which there is none in cultivation，contains some species known in Sierra Leone as bearing poisonous fruit．

83 Hippocrátea \(L\) ．

\section*{Order XXXII．MarcGraAVIACEE．}

Very curious half－climbing shrubs，all natives of hot countries．Some of them bear among the fiowers， which are large and showy，singular hollow bodies，like the pitchers of Sarracénia．The order has been well illustrated by Professor Hooker，in the 160th article of his Exotic Flora．

1163 Marcgraávia W．

\section*{Order XXXIII．ACERINE原．}

Valuable trees，native of the woods of Europe，Siberia，and North America．Their flowers are in all cases inconspicuous；the breadth and rich color of their leaves constituting their beauty．All the larger species abound in a very saccharine sap，from which sugar is prepared in North America；it is chiefly made from \(A^{\prime}\) cer saccharinum and Negindium，but may be obtained from many others．

2143 A＇cer \(W\) ．
2144 Negundium Dec．

\section*{Order XXXIV．MalpIGHIACEe．}

Undulated unguiculate spreading petals form one of the most obvious characters of this order，the species of which are all tropical，and are either trees or shrubs，often climbers．Many of the Malpighias are well known
for the prurient hairs produced on the surface of their leaves；their fruit is eatable，their timber of a deep red color，and their bark a febrifuge．Their showy pink or yellow flowers，and firm neat foliage，render all this order worthy of cultivation，except Aspicárpa，which is a weed．
1054 Malpighia \(W\) ．
1056 Hiræ＇a W．
1007 Gærtnéra \(W\) ．
1055 Banistéria \(W\) ．
29 Aspicárpa Rich．

Order XXXV．HYPERICINEE．
The whole of these abound in a resinous juice，and are in most cases glandular in some degree．Their leaves are all dotted，and which is very remarkable，the dots are often black，even upon the yellow petals．These latter have a singular obliquity，which is not indicated by their outline，but by the arrangement of their veins．The juice just noticed as abundant in this order is yellow，viscid，rather bitter，often purgative or anthelmintic；and so very analogous to Gamboge，that the juice of Hypéricum baccátum，and some other Guiana species，has received the name of Anerican Gamboge，Most Hypericineæ are bitter，and slightly astringent，whence they have been used as febrifuges．A small part of the order is tropical ；but in its most genuine form it censists of herbaceous or undershrubby plants，delighting in the shade of groves and thickets in the ccoler parts of Europe and Asia．Nearly all the flowers are yellow；those of \(\mathbf{H}\) ．cochinchinense are dull rea．

1617 Hypéricuin \(W\) ．
1618 Ascýrum \(W\) ．
694 Parnássia \(W\) ．

\section*{Order XXXVI．GUTTIFERE．}

Trees or shrubs found in the hottest parts of the world，and well known by their thick entire opposite leaves and resinous juice．In the countries where they grow they are of great iroportance．One，the Garcimia mangostána，bears a fruit，the equal of which is supposed not to exist．The well known Gamboge is the in－ spissated juice of Garcinia Gambógia，and，perhaps，other species；the juice of others is found an efficacious vermifuge，and also a remedy for the chiggers，one of the worst pests of equinoctial America．The bark and fruit of many Garcinias are astringent．The unripe fruits of Grías caulifira are pickled．The flowers of ail the order being showy，the foliage good，and the properties interesting，every species deserves cultivation．
\begin{tabular}{lll}
1079 Garcinia \(W\). & 1190 Mamméa \(W\) ． & 2151 Clásia \(W\). \\
1085 Canélla \(W\). & 1616 Xanthochýmus Row． & 1188 Grías \(W\) ．
\end{tabular}

1189 Calophyllum \(W\) ．
Order XXXVII．VINIFER⿸\zh14⿰⿺乚一匕十灬．
The vine is the type and representative of this order．Cissus and Ampelopsis differ little from it in botan－ ical characters，and not at all in habit．The common grape is the only species that bears really good fruit； the American kinds，with large fleshy berries，being spoiled by a disagreeable foxy flavor，which is not found to be removed by cultivation．
501 Vitis \(P\) ．S．
502 Ampelópsis \(W\) ．
s05 Císsus W．
454 Leéa W．

\section*{Order XXXIII．GERANIACEF，}

The Geraniums are well known to all gardeners for their beauty，and the facility with which hybrid varieties are produced among them．Geránium and Eródium are chiefly natives of the northern hemisphere； and Pelargónium of the southern．Different as they appear from Viniferæ in most respects，there are some points in which a curious resemblance may be found between the two orders．The young stems of both are articulated and separable at the articulations；and the lower leaves，are opposite，while the upper ones are alternate．In Geraniaceæ no tendrils are produced，but the peduncles are opposite to the leaves，as in Vítis， and occupy the place of tendrils．M．Decandolle observes，that of the true Geraniaceæ，some are slightly acid，especially those of which the leaves and bark are succulent；several exhale a resinous smell which is sometimes agreeable，but occasionally so powerful as to be unpleasant．The resinous principle is so abundant in Geranium spinósum，that its stem burus like a torch，and exhales an agreeable perfume．The most common property of European geraniums is to be astringent，which is chemically determined by their juice being blackened by sulphate of iron；this is particularly remarkable in G．Robertiánum and sanguineum， which are both accounted vulnerary，and in G．moschátum，praténse，and others，in which it is united to a slight aromatic principle，whence they have been recommended for various purposes，and among others for removing calculous disorders．The astringent property of the geraniums is also present in G．maculatum， which grows in much abundance about Pbiladelphia；the root of this plant，boiled in milk，is used for the cholera in children．Barton is of opinion，that it would be a good substitute for gum kino in nephritis and obstinate diarrhceas．

1460 Eródium W．
1461 Pelargónium \(W\) ．
1463 Geránium \(W\) ．
1465 Monsónia \(W\) ．

\section*{Order XXXIX．OXALIDEFE．}

Formerly confounded with the last order．It is the opinion of modern botanists，that the species are more nearly allied to Rutaceæ or Zygophylleæ，and that their character and peculiar habit is quite sufficient to distinguish them．The beauty of the genus \(O^{\prime} x\) alis is very great，and the readiness with which the species may be cultivated and caused to flower，would have been expected to make them universal favorites；they are not，however，much seen in cultivation．Their properties are well known ：all of them have a slightly acid taste，whence some have occasionally been employed as salad；their acidity is very agreeable and depends upon the presence of a small quantity of oxalate of potassa．In some of the species of equinoctial America oxalic acid exists in great abundance．Several species are employed in Brazil as a remedy for certain fevers of that country．

1064．Biophýtum Dec．
\(10650^{\prime}\) xalis \(W\) ．
1058 Averrhba \(W\) ．

\section*{Order XL．TROPAOLEE．}

These are climbing or trailing herbs with handsome solitary axillary flowers，and fleshy stems and leaves． They are distinguished from Geraniaceæ by their stamens being separate，and not agreeing in number with the petals ；by their axillary flowers，and fleshy indehiscent fruit．It is very curious，that this is the only order in which the peculiar acrid flavor of Cruciferæ is found to exist．Tropæ＇olum pentaphyllum，with probably other species，is a powerful antiscorbutic．All are natives of shady places in various parts of South America． The roots of some are fleshy and eatable．

875 Tropæ＇olum \(W\) ．

\section*{Order XLI．BALSAMINE厌．}

The flower of this order has been remarked by a learned botanist to be that of Fumariaceæ，the capsule of \(O^{\prime} x a l i s\), the embryo of Linum，and the habit peculiar．The well－known elastic spring with which the seeds are ejected，constitutes a principal character of the order．All the species are annuals，with the exception of Impátiens fruticósa；they delight in moist hot situations，generally within the tropics；and are remarkable for the singularity and varied colors of their flowers．

538 Impátiens \(\boldsymbol{W}\) ．
Order XLII，ZYGOPHYLLEA．
The hardness of the wood of the shrubby species of this order is most remarkable，if the softness of the etems of the herbaceous ones is remembered．To this the extreme difficulty of propagating Guaiacum is to
be attributed．Zygophyllum Fabago is employed as an anthelmintic，but it is in the Gualacum that the great medical virtues of the order are found：all the genus is extremely exciting；the wood and bark of Guaí－ acum officinále and sánctum have a rather bitter acrid flavor，and are principally used as sudorifics， diaphoretics，or alteratives；they have been found to contain a particular substance differing both from gum and resin，which has been called guayacine．Many of the species bear beautiful flowers，especially the Tribuluses，which with their brilliant yellow Cistus－like blossoms，enliven many a barren rock in the tropics． None are found in the colder latitudes of the world．

994 Zygophýllum \(W\) ． 995 Fagónia \(W . \quad 996\) Tribulus \(W\) ． 993 Guaíacum \(W\) ．

\section*{Order XLIII．MELIACEE．}

The nearest affinity of this order is probably with Sapindaceæ．It is particularly distinguished by the stamens being united into a tube bearing the anthers．The leaves are usually pinnated，and most of the species，which are all either trees or shrubs，are natives of tropical forests．Mélia bears bunches of fine lilac colored flowers，but few of the genera are interesting on account of their inflorescence．The qualities of the different species are little known．Canélla álba is aromatic，and is used in equinoctial America as a spice． The bark of Guarea trichilioides is said by Aublet to be purgative and emetic．The pulpy fruit of Mélia Azedarach is said to be poisonous；both this part and the inner bark have been used as anthelmintics either in substance or in decoction．It is asserted by Michaux，that the pulp that surrounds the kernel is considered in Pekin a specific in scrophulous cases．The oil expressed from the seeds of the same plant is said to have strong antispasmodic powers．
\begin{tabular}{lll}

987 Trichilia \(W\). & 989 Quivisia Cav． &
\end{tabular}

\section*{Order XLIV．CEDRELEA．}

Some of the finest trees of the tropical regions of the globe are comprehended in this order，as the well known mahogany，and the New Holland cedar，which is a species of Cedréla．Their winged seeds distinguish them from Meliacea．The bark of Cedréla Thna is employed in the East Indies as a febrifuge，as is also that of the mahogany in the West．But the most powerful remedy for fevers in the whole order is the Soymida of the West Indies，which is the produce of Swietenia febrifuga；its taste is bitter and nauseous，and its virtues are extolled as equalling those of Cinchóna．

990 Swieténia W．

\section*{531 Cedréla \(W\) ．}

\section*{Order XLV，AURANTIACEÆ．}

These are also known under the name of Hesperidec．They consist of trees or shrubs of the greatest beauty and utility．The well－known orange and lemon are the representatives of the order，the characters of which are so well defined that there is no material deviation from the type afforded by those species．The thick leaves，articulated with their petiole，and abounding in transparent reservoirs of odoriferous oil，are the most obvious peculiarities．The flowers are fragrant，and the fruit in all cases fleshy，and generally eatable．The wood is particularly close－grained．The volatile oil contained in the reservoirs of the leaves and fruit possesses powerful tonic and stimulating properties．M．Decandolle thus explains the singular structure of the fruit of the orange．In the opinion of this learned botanist it consists，first，of a thick，valveless，indehiscent indusium or coat，which is most likely to be considered a continuous torus．Secondly，of several carpella，verticillate around an imaginary axis，often separable without laceration；membranous，and either containing seeds only， or filled with pulp，lying in innumerable little bags proceeding from the inner coats of the cells．

\section*{Order XLVI．TERNSTROMIACE压．}

A very small order，consisting wholly of trees or shrubs，bearing handsome white or yellowish flowers．They are nearly related to Camellieæ，from which they do not differ at all in habit．Nothing is known of their pro－ perties．Noronha states that a species of Saurauja found in Java has a subacid fruit，in flavor resembling the Tomato，and that it is eaten by the Javanese under the name of Koleho．
\[
1083 \text { Eírya } T h . \quad 1494 \text { Gordónia } W . \quad 1495 \text { Stuártia } W .
\]

\section*{Order XLVII．CAMELLIE无．}

Camellias are too well known in our gardens to render it necessary to say much upon their peculiarities． The Camellia is one of the most beautiful，and the tea one of the most useful，plants in the world．Both are natives either of China，Japan，or Nepal．The tea is well known for the stimulating influence of its decoction upon the nerves，which is attributed by Cullen to the presence of a narcotic principle．The seeds of Camellia ofeifera yield a fine oil．None of the species bear fragrant flowers．Their nearest affinity is with Ternströmi－ aceæ，from which they probably ought not to be separated．

1496 Caméllia Ker

\section*{Order XLVIII．OLACINE写．}

Smooth trees or shrubs，with simple stalked exstipulate alternate entire leaves，and little axillary flowers． Botanists doubt whether what is called a calyx is not rather an involucrum，in which case the corolla would become a calyx，and the station of the order among Monochlamydeæ，rather than in this place．

890 Ximénia \(W\) ．

\section*{Order XLIX．RU＇TACEE．}

An interesting and extensive，but rather heterogeneous，group of plants，natives of all countries and all situ－ ations．The species are either fetid northern herbaceous plants，as the garden rue，or neat heath－like southern shrubs，with an aromatic odor，as the Cape Diosmas；broad or long－leaved Australasian shrubs，with a stellate pubescence，as Phebálium，or tropical trees with panicles of pallid minute flowers，as the Cusparias and Xan－ thóxylums．The order contains nearly 300 species，of which but a small proportion is in our gardens．The medical properties of many genera are considerable．Rúta and Péganum are emmenagogue，anthelmintic，and sudorific．Diósma abounds in a volatile oil of an agreeable smell，but acrid flavor；several of its species are reputed antispasmodics．The Xanthóxylums are said to possess acrid，stimulating，or tonic qualities；Cláva Hérculis and fraxineum are said，in America，to be powerful sudorifics and diaphoretics．According to Barton，they possess a remarkable power of exciting copious salivation，not only when applied to the mouth， but even when taken internally；they have both been found powerful remedies in paralysis of the muscles of the mouth．Xanthóxylum cariba＇um is regarded in Guiana as a detersive vulnerary and febrifuge．The famous febrifugal Angostura bark is the produce of Cuspária febrifuga．

303 Fagára \(W\). 2066 Xanthóxylum \(W\).
Tribe 4. Cuspariee
41 Galipéa Aubl. 1500 Monniéria \(\boldsymbol{W}\).

\section*{Order L. CORIARIEE.}

Five species constitute the whole of this order, distributed in South Europe, New Zealand, Peru, and Mexico. They possess no beauty, and are only interesting on account of their problematical station in a botanical arrangement. The leaves of \(\mathbf{C}\) myrtitólia are astringent, and are employed in dying black. Its berries are very poisonous. On one occasion, during the Spanish war fifteen French soldiers were taken ill after eating them, and three died from their powerful narcotic effects.

2091 Coriária W.
Section 4. Fruit (gynobasic) inserted into a fleshy receptacle, with which the style is continuous.

\section*{Order LI. OCHNACEA.}

Beautiful yellow-flowered tropical shrubs or trees with lucid leaves. The roots and leaves of Walkéra serráta, a Cingalese plant, are bitter; a decoction of them, either in water or milk, is used in Malabar as tonic, stomachic, and antiemetic. The bark of Gómphia hexasperma is found useful in healing sores produced in cattle in Brazil by the stings of insects.

1001 Gómphia \(W\). \(1191 O^{\prime}\) chna \(W\).

\section*{Order LII. SIMARUBACES.}

Thirteen plants, found in equinoctial America, constitute this order. They are trees or shrubs, with an intensely bitter bark, a milky juice, and pinnated leaves. The Quassia is well known as the most pure and intense bitter hitherto discovered; the same property exists, in a milder degree, in the rest of the order. Quássia amára is a very ornamental plant, but rare, at present, in collections.

1002 Quâssia W.

\section*{Subclass II. CALYCIFLORE圧.}

\section*{Petals separate, inserted into the calyx.}

\section*{Order LIII, CELASTRINEF.}

This order differs from the succeeding, in having the stamens alternate with the petals; the sepals imbrlcated in æstivation; and the ovarium wholly superior. It consists entirely of shrubs or small trees, with simple, rarely compound, alternate or opposite leaves, and inconspicuous flowers of a greenish or white color. Several are favorite ornaments of our shrubberies, as the Staphyléa, the Celastrus, and the Euonymus; the latter of which is valued on account of its beautiful-colored fruit. The fruit of Euónymus europr' us is a brisk purgative, as is also the inner bark, and in strong doses powerfully emetic. The famous Paraguay tea is the foliage of a species of rlex. The bark of Prinos verticillatus possesses such active, astringent, bitter, tonic, and febrifugal qualities, that it is used in North America, with success, as a substitute for Cinchóna. A decoction of the twigs of Maýtenus boaria is used to bathe the swellings produced by the poisonous shade of the tree Lithi.

Tribe 1, Staphyleacee.
684 Staphyléa \(\boldsymbol{W}\).
Tribe 2. Euonymes.

828 Prínos W.
543 Plectrónia W.
514 Schrebéra Retx.

\section*{Order Liv. RHAMNEE,}

In nabit, this altogether agyees with the last, from which the medical properties of the species are not widely different. Throughout the order, as far as it has been examined, there is a remarkable agreement between the fruit and the inner bark, especially in Rhámnus cathárticus, frangula, and others, in which they both are purgative and emetic. Some, as the Jujuba, and the African Lote, nevertheless, yield a wholesome and agreeable fruit ; and the berries, of the greater number, yield, under the chemist's hands, green or yellow dyes of much importance in manufactures. The leaves of Rhamnus theézans are substituted for tea by the poorer sort among the Chinese. The bark of Ceanothus carfleus is esteemed in Mexico as a good febrifuge.

\end{tabular}

\section*{Order LV. BRUNIACE压.}

Small heath-like shrubs, all natives of the Cape of Good Hope, and extremely ornamental, both in flower and foliage. Their properties are unknown.

\section*{533 Bránia W.}

511 Stáavia \(W\).

\section*{Order LVI. SAMYDEA.}

Tropical shrubs or small trees, with entire, stipulate, alternate leaves, covered with pellucid dots, and axillary flowers of little shew. Some of the species of Samyda are pretty, but very rare. Their properties are unknown. M. Decandolle remarks, that in their fruit they approach Bixineæ and Flacourtianeæ; but on account of the position of their stamens must be arranged in the vicinity of Rhamneæ and Rosaceæ.

\section*{Order LVII. HOMALINEAE.}

Evergreen handsome shrubs, with alternate leaves and deciduous stipule ; they are readily known by their parietal placentæ, an unusual character among the orders that surround them. Blackwélia fagifolia has fine bunches of starry white fragrant flowers. Aristotelia is an evergreen half hardy shrub, with eatable berries. Little is known of their medical properties; the root of Homálium Racoubea is used in Guiana as a cure for gonorrhœa.

1108 Blackwéllia Juss.
873 Astránthus \(L\).
1084 Aristotélia W.

\section*{Order LVIII. TEREBINTHACE}

This order is, notwithstanding the labors of several botanists, in a very confused state; from want of sufficient knowledge of many of the genera, which have been hitherto imperfectly described, it is difficult either to determine the value of the characters assigned to the tribes, or the dignity of the tribes themselves. All the species are shrubs or trees, with alternate exstipulate leaves, and inconspicuous flowers, and abound in a balsamiferous resin, which is chiefly present in the leaves and bark, and from which the denomination of the order has been derived. Notwithstanding the minuteness of their flowers, many of the species are valuable as ornamental plants, on account of the beauty of their foliage, others for the sake of their utility in arts or medicine, and others for their fruit. The walnut, the Cashew nut, and the Pistachio are valuable for their nuts, which are well known articles of the markets of Europe. The Spóndias and Mángo are equally famous in the tropics. The well-known balsam of Tolu is the produce of the Toluifera; the balsam of Mecca, of the Amýris gileadénsis; and balm of Acouchi, of the I'cica acuchini; gum comes from Amyris elemitera and I'cica leptophȳlla; mastich from Pistácia atlántica and lentíscus; and Venetian turpentine from Pistácia terebínthus. Schinus Mólle produces a resin which in Peru is used as a dentrifice, as myrrh is with us. Some of the best varnishes are prepared from the exudation of Amyris guianénsis, Rhus vérnix, copallína, and others; the finest kinds of incense are also afforded by plants of this order, such as the wood and resin of the different species of I'cica, of Amýris balsamifera, and of Canárium commane, the Coumia, which is used in Guiana for such purposes, and finally, the Boswellia thurifera, which is the true frankincense of Indian temples. But among the fragrant and wholesome plants of which the order chiefly consists, lie concealed others in which acrid and poisonous qualities no less abound. Such are several pieces of Rhus, the juice of which produces blisters upon the skin, and the Amýris toxifera, the juice of which is accounted poisonous. To conclude this long list of the uses and dangers of Terebinthaceæ, the bark of Brincea is used as an astringent in dysenteries, that of Rhus glábra as a febrifuge and as a mordant for red colors, and that of Rhus coriária as a powerful means of tanning skins of animals. It is curious to remark how strongly Terebinthacea are connected with Amentaceæ through Júglans.

1999 Júglans W.

\section*{Order LIX. LEGUMINOS天}

The family to which the various kinds of pulse belong is one of the most familiar to the world, and at the same time one of the most useful to mankind. Their papilionaceous flowers characterise a large number, and their pods and ginnate leaves the remainder, with a few exceptions, which it is not necessary to particularise. As objects of ornament, many are possessed of unrivalled beauty, for example, among hardy flowering trees, the Robinia and the Laburnum; among shrubs, for decorating the borders of the flower-garden, the various tribes of Cýtisus, Caragāna, Colutèa, Amórpha, and others; among hardy climbers, the far-famed Glýcine of China, and its sister of North America, with the species of the herbaceous genera Vicia and Lathyrus; and, lastly, among hardy herbaceous plants, the numerous species of Lupimus and Astrágalus. Great, however, as is the beauty of the Leguminosæ which can brave the inclemencies of the seasons of Ner, as give way before the splendor and elegance of their brethren of the tropics. The flowers of the Erythrina, or Coral tree, are of the deepest crimson, and borne in profusion upon some of the loftiest trees of the forest. The Bauhinias, with their snake-like stems and twin leaves, hang in festoons of flowers from branch to branch of other trees, and are only rivalled by the less vigorous and elegant, but more richly colored blossoms of the Carpopogons. But all these, with their broad heavy foliage and gaudy colors, are far surpassed by the rugged trunks, trembling airy foliage, and golden flowers of the Mimosa, which cast a charm over even the most sterile deserts of burning Africa. While the forests of hot countries are thus indebted to species of this order or their timber, the meadows and pastures of the same latitudes are enamelled with the flowers of myriads of Hedysarums, and animated by the wonderful notion of sensitive plants. As in our own country, the gayest part of our scenery is in many places indebted to the yellow flowers of our furze and broom, so in other countries the same effect is produced by other genera of Leguminosæ; by Lipária, Borbónia, and Aspálathus, at the Cape of Good Hope, and by the Pultenæ'as, Daviésias, Aútuses, and multitudes of similar genera in New Hoiland. The wood of the order is very hard and durable, with a yellow tinge, sometimes changing into green, as in the Labírnum of Europe, and in the better known Brazil wood of commerce, produced by desalpinia. The following useful remarks upon the properties of the order are made by M. Decandolle :-
\({ }^{66}\) The family of leguminous plants, though established upon characters of primary importance, offers, nevertheless, so large a number of species and such singular botanical anomalies, that it is easy to foresee that its properties will exhibit little uniformity. Still more exceptions may be anticipated if one reflects, that the che. nical principle which is found most abundantly in every part of leguminous plants, and to which we must attribute their principal properties, is the extractive. It is probable that this principle, either from its own nature, or from its peculiar power of uniting with different matters, or perhaps instead of being a simple principle, it is rather a compound of different matters; it is probable, I say, that the extractive principle exhibito
much less uniformity in its results than any other. It is, without doubt, to the presence of the extractive principle, in considerable quantities, that many leguminous plants owe their purgative properties, which are common to several extracts, and which many chemists attribute to the acetate of potash, which they are almost universally found to contain. Thus the leaves and foliaceous pods of Cássia sénna Lin., of Cássia lanceoláta Forsk., of Cássia emargináta of the Antilles, of the Cássia marylándica employed in the United States, of Colùtea arboréscens, of Spártium púrgans, and perhaps also of Coronilla émerus, act as brisk purgatives, and often cause wind and pain in the bowels. The juice of Coronilla vária excites vomiting, and may even become poisonous when taken in too large quantities. It is, perhaps, from a different cause that the pulp which is contained in the husks of leguminous plants operates upon the human body; it purges gently without causing the least pain, and ought to be considered as laxative rather than purgative. Such is the character of the juicy pulp that exists in the Cássia fistula Lin., in the Tamarindus indica Lin., in the Ceratonia siliqua Lin., and probably in the Mimósa inga and the M. fagifólia, which are eaten in small quantities in the Antilles, but which, taken more copiously, would have the same effect as our Carobs. There are some fruits of Leguminosæ, for example, the Sophóra and the Gleditschia, with tumid pods, in which is found a juice which surrounds, it is true, the seeds, as in the plants just mentioned, but which differs from them altogether in its very astringent and nauseous fiavor; the nature and properties of this juice deserve to be exammed by chemists, and would undoubtedly throw some light upon the nature of Leguminosæ. I am induced to think, that the astringent juice of the Sophóra is a secretion of the pericarp, whilst the sweet and purgative juice of the Cássia would be a secretion of the external part of the seed; but this hypothesis requires to be verified: what leads me to this opinion, is the flavor commonly found in husks; in the Carobs, for example, the husk is astringent, and the pulp sweet and laxative. But let us return to the properties which may be attributed to the extractive principle. It is undoubtedly from some one of these modifications that the singular property of the Piscídia and many Galégas is derived, which are employed in America to stupefy fish, which are taken by this means as readily as with Nux vómica. The decoction of the root of Galéga virginiána is considered in America as a powerful vermifuge. It is, perhaps, indeed, to the very same cause that the rubefacient powers of the fresh leaves of some Leguminosæ are to be ascribed, which act readily upon the skin if applied as plasters; as, for example, in Ornithopus scorpioldes among ourselves, and Hyperanthera moringa elsewnere. It appears to me, that it is to the greater or less considerable mixture of the extractive principle with the fæcula contained in the seed, that the different properties of the pulse of leguminous plants may be attributed. If found in small quantities, the seed may serve as food for man and animals, as we see in French beans, peas, lentils, chick peas, beans, and many others, \&c. If found in a more considerable quantity, it will render them purgative or emetic, as in the Cýtisus labưrnum, the Anagýris fo'tida, and even in most Coronillas, It is remarkable that the botanical characters of Leguminosæ should so strictly agree with the properties of their seeds: the latter may be divided into two sections; namely, first, those of which the cotyledons are thick and filled with fæcula, and destitute of cortical pores, and which, moreover, in germination do not undergo any change, but nourish the young plant by means of that supply of food which they already contain; secondly, those of which the cotyledons are thin, with very little fæcula, and furnished with cortical pores, and which change at once into leaves at the time of germination for the purpose of elaborating food for the young plant. All the seeds of the first section are employed as food in different countries; none of those of the second section are ever so employed; the Cajan, which bas long been classed among the Cýtisi, was apparently an exception to this general rule; but observation has proved the contrary. Bearing in mind its known properties, I formerly paid particular attention to its structure, and I have shown in a note, which accompanies my catalogue of the Montpelier garden, that the Cajan forms a particular genus much more nearly allied to the French bean than to the Cytisi, and that it, in fact, belongs to the first of the sections which I have just described. The seeds of Leguminosæ present also many other anomalies more difficult to reduce to any fixed laws: thus some are found which contain a rather large portion of fixed oil ; such as the seed of the A'rachis hypogæ'a, lately introduced into European agriculture, and that of Guilandina moringa which produces oil of ben; there are some, of which the flavor and smell are rather powerful; as the seed of Dipterix or Coumaroana odbra of Aublet, which, under the name of Tonquin bean, is used for perfuming snuff; there are others which, like the chick pea, have rather a bitter taste and exciting properties, and are on that account administered for the jaundice. There are others again, like those of the Andira, which are so bitter as to be used in Java and Brazil as tonic, alexiteric, and vermifuge. In a word, are not the aperient and diuretic properties which are observable in the herbage and the roots of many leguminous plants, such as broom, beans, Onónis, Guilandina rínga and moringa, Anthyllis crética, \&c. to be attributed to a modification of this extractive principle? There are, in another view, roots which are furnished with tubercles, that is to say, with reservoirs of fæcula which furnish mankind with wholesome food, as we see in the Láthyrus teberósus, which is eaten in Holland, the Dólichos tuberósus, and the D. bulbósus, which the Indians use as food. The roots of the liquorice have a sweet and mucilaginous taste, which is well known by every body, and which, united to an acrid and rather exciting principle, causes it to be employed as a pectoral ; the analysis of this root, published by M. Robiquet, proves that independently of its woody skeleton, the same kind of amylaceous fecula is found as in the tuberous roots of which we have just been speaking; it is thence seen that the acrid Havor of decoctions of liquorice depends on the small quantity of resinous oil which it contains, and that its sweet properties are by no means analogous to common sugar, since it is insoluble in cold water, soluble in warm water or in alcohol, not capable of fermentation, and does not yield to the action of nitric acid any of the known products of sugar. It may here be added, that the sugary flavor of liquorice, and its other properties, are not confined to this genus; they are found equally in the roots of Tritólium alpinum, vulgarly called Mountain liquorice ; in those of the A'brus precatorius, from which a pectoral draught is prepared in Hindoostan, called Velti, and in others. The barks of some trees of the leguminous class, are remarkable for their bitterness, and are used as febrifuges; the different kinds of Geoffroya possess this bitter and febrifugal quality in a remarkable degree; in India, the bark of the Eschynómene grandifóra and of the Cæsalpinia bonducélla are employed for the same purpose. The barks of many leguminous plants are also remarkable for their astringent qualities, caused by the quantity of tannin which they are found to contain; this is observable in the Acacia Catechu, and in the Acácia arábica, which is used for tanning leather, and elsewhere. It is well known that almost all coloring mitter proceeds from the extractive principle; and as it appears that this principle abounds in Leguminosæ, we ought to find in them a considerable number of the colors which are used by dyers: to this family, in fact, belong the principal blue colors, known by the name of indigo, extracted from every kind of Indigofera and from some Galégas ; and the red colors, which are yielded by all the species of Cæsalpinia and of Hæmatoxylon. We may add the red juice, which is drawn from the Pterocárpus dráco and Santalinus, under the name of sandal and of dragon's_blood; from Erythrina monospérma, under the name of gum lac; and also from Dalbérgia monetária. These juices appear to differ in many particulars, but their history and analysis are at present so far from being known, that it is impossible to form a true estimate of the nature of their differences. But anomalies of this nature are far from being confined to the plants just mentioned. Among the exotic drugs employed in the arts they are very common: such, for example, are the balsam of Capivi, produced by the Copaifera; the balsam of Peru, which, Mutis says, is obtained from Myroxylon ; the Cachou, which has been found to be afmost pure tannin, and which is supposed to be produced by Acácia Cátechu; of the same character is that remarkable resin that is yielded by Hymenæ'a Courbaril; gum Arabic, produced by the hark and roots of Acácia senegalénsis, nilótica, arábica, and others; gum tragacanth obtained from Astrágalus créticus, gummífera, and vérus; and finally, manna, secreted by Hedýsarum alhági,"

The arrangement of this tribe of plants has been found to be attended with much difficulty. By Linnæus, and the writers who succeeded him, the number of genera was much smaller than those admitted by botanists of the present age; many additions have been made in consequence of the discovery of New Holland, and a large number of subdivisions in old genera hive been from time to time introduced by one writer or another. To combine these scattered improvements under one uniform system has lately been attempted by the learned botanist, from whom the foregoing extract has been taken. This was not executed at the time when those parts of the present work, in which leguminous plants are found, were written; for which reason the names

\section*{NATURAL ARRANGEMENT.}
of the suborders will not be found in the body of the work. M. Decandolle's method, however, being here adopted, it will be useful to explain the principles upon which it is founded. He divides Leguminosæ into two grand divisions, the first of which consists of plants, the radicle of whose seed is curved back upon the edge of the cotyledons, and the second of those whose radicle and cotyledons are straight : the former are Curvembrife, the latter Rectembris. In the Curvembriar, certain diversities in the structure of the calyx and corolla again divide into two principal forms, one of which, comprehending all the genera with papilionaceous flowers, is called Papilionaceæ, and the other, consisting of a very small number of species, with one or two petals or more, and an obscurely lobed calyx, is called Swartziez. The last is not subdivided, but the Papilionaceæ resolve themselves into the two great tribes pointed out by M. Decandolle, namely, those with fleshy cotyledons and eatable pulse, Sarcoloba, and those with foliaceous cotyledons and seeds which are not eatable, Phyllolobe. Each of these is divisible by three, upon slight differences in the fructification. In Rcctembrice two suborders, Mimoseæ and Cæsalpineæ, are formed upon variations in the æstivation of the calyx and corolla; in the former, it is valvate, in the latter, imbricated; the first constitute a single tribe, the latter divide into three, distinguished by less momentous peculiarities of structure. Having premised thus much, the following tabular explanation will be intelligible:
I. CURVEMBRI

Papiliunacee.
a. Phyllolobz.

Tribe 1. Sophorea. Pod continuous. Stamens distinct.
Tribe 2, Lotece. Pod continuous. Stamens united by the filaments.
Tribe 3. Hedysarea. Pod with transverse articulations. Stamens mostly united by the filaments.
b. Sarcolobæ.
2. Swartziefe

Tribe 4. Viciea. Pod polyspermous, dehiscent. Leaves cirrhous, the first alternate
Tribe 5. Phaseolea. Pod polyspermous, dehiscent. Leaves not cirrhous, the first opposite.
Dalbergiec. Pod one or two-seeded, indehiscent. Leaves not cirrhous.
Tribe 7. Swartziea
II. RECTEMBRIEL
1. Mimuse e.

Tribe 8. Mimosea.
2. Cesalpinee. Tribe 9. Geoffrea. Sepals and petals imbricated in æstivation. Stamens variously connected by the filaments.
Tribe 10. Cassiece. Sepals and petals imbricated in æstivation. Stamens distinct.
Tribe 11. Detariea. Sepals before expansion indistinct, calyx bladder-like. Petals 0.

\section*{Order LX. ROSACE无。}

With the exception of Chrysobalaneæ and Sanguisorber, this order is so uniform in its appearance, that Rósa, the type from which all the other genera are to be considered variations, when justly understood, will be found to contain every form of structure which is essential to the order. Having stated this, it will be at once obvious, that if the other genera have such close affinity to Rosa, they must also bear a great analogy in beauty. And this is, indeed, the fact. Amýgdalus and Prúnus among trees, and Potentilla, Géum, and others, among herbaceous genera, rival the rose in their blossoms, and, in many particulars, surpass that most lovely of all flowers in foliage and general appearance. But it is not for charms alone of smell, or blossom, or foliage, that this order has fixed itself so high in the estimation of mankind. It has also the rare merit of comprehending all the most important of the fruits of the temperate regions of the world. Thus the apple and the pear belong to Pyrus, the plum and the apricot to Pronus, the peach and the nectarine to Amygdalus; Eriobótrya produces the loquat, Méspilus the medlar, and finally, the quince is borne by the Cydonia. The medical powers of many plants of this order are not less active than their fruit is excellent. The principal of these is the well-known Prussic acid, which exists in abundance in the leaves and kernels of many genera, especially of Prúnus and Amýgdalus ; it is the basis of Laurel water, which, when taken in small doses, acts either as a violent purgative or as an emetic; and, in stronger doses, is said to destroy irritability without exciting inflammation; these properties, however, although thus dangerous in the distilled water of the laurel and other similar plants, can scarcely be said to exist in any important quantity in the plants in a state of nature. The kernel of the bitter almond, for example, in which the Prussic acid is more abundant than usual, is used for many culinary and other purposes without any bad effect. There are, however, cases in which it is said to be dangerous to eat the fresh leaves or kernels; as in the Pranus virginiana, the leaves and fruit of which are reputed in the United States to be poisonous to certain animals. Besides the Prussic acid, there are several other principles which abound in the order. All Drupaceæ yield a gum which is nearly allied to gum Arabic, and which affords a strong evidence of the affinity that exists between Rosaceæ and Leguminosæ. A great deal of astringency is found in many species, whence different parts have been occasionally employed as febrifuges, and as remedies for hæmorrhage, diarrhœa, and dysentery. The root of the Tormentilla is used for tanning in the Ferro Isles; and that of the Capollim cherry in Mexico. The bark of Prunus virginiana is used as a febrifuge in the United States; Potentilla réptans has been praised for the same properties. The root of Géum urbánum has been found, by Milandi and Moretti, to contain one eleventh of its weight of tannin; it has been used both in America and Europe as a substitute for Jesuit's bark. The leaves of Drýas octopétala in the north of Europe, of Rubus árcticus in Norway, of Pranus spinósa and ávium, and of Rósa rubiginósa have been manufactured into a sort of substitute for tea. The bark of the root of Gillénia trifoliáta is remarkable in having, in addition to the astringency already mentioned, an emetic property, on which account it is employed in North America as Ipecacuanha. It is said, that a similar power exists in other Spiræ'as.

It must not be omitted, that the order Rosaceæ nearly answers to the Icosandria of Linnæus.

\section*{Order LXI. SALICARI压}

Most of these are very showy plants, in particular the genera Lythrum and Lagerstroe'mia, which are the representatives of the order. They are chiefly natives of temperate climates, on mountains and among busbes. Glaux and Péplis are common shore plants in England. Heimia is remarkable for its yellow fowers. Little is known of the properties of Salicariæ; they are mostly astringent; the common Salicaria is used in inveterate diarrhoeas; a species of Lythrum is used in Mexico as a vulnerary and astringent, and Lawsónia, which is used by the Turkish women to stain their nails, is also supposed to possess similar properties. There is a plant of this order called Hanchinol in Mexico, which is said to possess much more remarkable powers than any of the preceding ; its expressed juice, taken in doses of four ounces, excites violent perspiration and secretion of urine, and is said to cure venereal disorders in an incredibly short space of time.

Order LXII. MELASTOMACEE,
All these are remarkable as handsome tropical shrubs or trees, with large purple or white flowers, and leaves with several costæ, or nerves as they are incorrectly termed. The genera admitted in the body of the work are those received by the greater part of previous writers; they have been much increased, and apparently with great propriety, by Mr. D. Don. The species are generally ill treated in collections, where they are not unfrequently to be found under the form of sickly stunted plants, instead of noble broad-leaved spreading shrubs, with masses of brilliant flowers. To be grown well they require much heat, much moisture during the summer, and much pit-room and head-room. The fruit of true Melāstomas is a fleshy insipid juicy berry, which is for the most part eatable, and is often so deep a black as to dye the teeth and mouths of those who eat it. They are nearly related to Myrtacex, from which they differ in the want of essential oil, and of the dot-like reservoirs of the leaves which contain it. The juice of the leaves of M. succósa and aláta is used as a lotion for recent wounds by the inhabitants of Guiana.

\end{array}
\]

\section*{Order LXII. MYRTACEIE.}

Dotted leaves, with marginal ribs, and an inferior ovarium and single style, are the great features of Myrtaceæ. They are all fine evergreen shrubs or trees, generally bearing white fowers, and in the first section producing fleshy fruit. It is there that the Allspice, the Clove, the Rose-apple, and the Guava find their station, by the side of the common myrtle and pomegranate of Europe. The section with capsular fruit comprehends, with the exception of the gigantic Eucalyptuses, almost wholly, handsome hard-wooded New Holland or South Sea shrubs, with white or crimson flowers and stamens; yellow flowers are very uncommon. The volatile oil contained in the little reservoirs of the bark, the leaves, and the floral envelopes, gives these plants the fragrance which has caused them to be celebrated by poets of all ages. It is very aromatic, a little acrid, and slightly tonic and stimulant, whether it is under the form of Cajeputi oil, the produce of Melaleúca leucadéndron, or of oil of cloves or of myrtle. In the clove this oil is so abundant as to constitute nearly a fifth of the whole weight of the calyxes that produce it. There is also a considerable proportion of astringent principle in these plants; in the bark of the pomegranate it is very obvious; and in Myrtus régni and lama of Chile, Eugénia malaccénsis, it is so abundant as to render a decoction of those plants of great use in cases of dysentery. Eucalýptus resinifera produces an astringent resinous substance resembling gum Kino. The leaves of the Chilian myrtles, Leptospérmum scopárium, and some other species, have been used as substitutes for tea.

\section*{Order LXIV. COMBretacee,}

Combrétum and Quisqualis are among the most splendid of the climbing plants of the tropics, adorning the trees from which they depend with garlands of white and crimson, and yellow. The bark of Bucida Búceras is used with success in Guiana for tanning leather. The juice of Terminália vérnix is employed by the Chinese as a varnish; it is, however, caustic, and its exhalation dangerous; benzoin is the produce of Terminalia Benzoin. The kernel of several species is eaten as a nut, and the expressed oil has the remarkable quality of not becoming rancid.

514 Conocárpus \(W\).
1027 Getónia Roxb.
2140 Terminália \(W\).
916 Combrétum \(W\).
1028 Quisquális \(W\).

\section*{Order LXV. PASSIFLORE风.}

The beauty of Passifloras is well known; they are remarkable for the singular arrangement of the stamens and pistillum, upon a column surrounded by several lines of circumvallation, formed by as many rows of barren thread-like colored stamens, which are popularly called the rays. The fruit of several species of passionflower is filled with a pleasant acidulated pulp, on which account they are eaten as dessert fruit. It is not known that they possess any medical properties. The station of the order is not settled; it is undoubtedly very near Cucurbitaceæ.

1459 Passifóra \(W\).
2075 Modécca Lam.
Order LXVI. CUCURBITACER.
Here is the station of the gourd, the melon, and the cucumber, succulent climbing vegetables, the fruit of which administers to us many of our comforts and necessities. The importance of the gourd in hot countries is of the highest degree, where, from the nature of the climate, few of those culinary vegetables that are so abundant in the north can be made to succeed. Among these tribes of climbing annuals, the papaw tree is a remarkable deviation from the ordinary character of the vegetation. Its fruit, however, and flowers are in all respects those of Cucurbitaceæ. The fruit is mostly sweet, watery, refreshing, and pleasant to the palate; but the coloquintida gourd, the spirting cucumber, and the Trichosánthes amara, are all possessed of violent bitter, drastic, purgative qualities, which are, indeed, to be found, in a slight degree, even in the mildest of the eatable gourds. M. Decandolle observes, that as the violent action of the Colocinth resin is much softened by the mixture with it of gum, it is probable that the difference in the fruits of the order depends upon the different proportions between these two substances. The seeds of the gourd, like those of the
passion-flower, possess none of the properties of the pulp; they are sweet and nutty, and readily form an emulsion. The roots of the bryony are purgative, but also contain a wholesome fæcula. It is said that the roots of a species of bryony are eaten in Abyssinia, after being merely boiled. There are some Cucurbitaceæ, the roots of which are intensely bitter; those of one of this description are used in Peru, to remove the pains attendant upon inveterate venereal disorders.

27 & Callitriche \(W\). & 1968 Serpicula \(W\). & 258 Isnárda \(W\).
\end{tabular}

\section*{Order LXIX, ONAGRARIE.}

A very well defined order, generally known by its pollen cohering, by a sort of filamentous substance, an inferior polyspermous ovarium, a tetrasepalous tetrapetalous flower, with a definite number of stamens, and a single style. From this form there are some anomalous variations, such as Circæ'a and Lopezia, which are, however, easily reconciled to the usual structure of the order. Most of the genera are pre-eminently beautiful; as Epilóbium, Enothéra, and Fuchsia, which are old favorites among gardeners. The properties of Onagrariæ are little known, and probably very weak. The leaves of Jussiæ'a peruviána are used as an emollient poultice, the seed of Trápa nátans as an eatable nut, and the root of Onothéra biénnis as a sort of salad.

> 902 Gaúra W.
903 Epilóbium W.
904 Fúchsia \(W\).
308 Trápa \(W\).

\section*{Order LXX. FICOIDEE.}

These are all plants with a greater or less degree of succulence; the Mesembryanthemums and Hymenógyne are well-known dry-stove plants, many of which are beautiful in the highest degree. Of the former of these two, the flowers are of all colors, many of the most vivid hues, and remarkable for expanding only beneath bright sunshine; this phenomenon, indeed, is common to the whole order. Tetragónia expánsa, Sesúvium portulacástrum, and Mesembryánthemum edéle, are excellent substitutes for summer spinach. A large quantity of saline matter is contained in all of them; in Reaumória vermiculata, a substance is secreted, which has been found by chemical analysis to consist of muriate of soda and nitrate of potash. The whole order grows in very dry or saline places, in the temperate regions of the world. Four fifths of the whole are natives of the Cape of Good Hope. The leaves of the different species of Mesembryán. themum, offer the most remarkable instances of figure known in the vegetable world.

1147 Hymenógyne Haw.
1107 Glinus \(W\). 1144 Aizóon \(W\). 1146 Mesembryánthemum \(L .1210\) Reaumúria \(W\).

\section*{Order LXXI. PORTULACEEA.}

With the excẹption of Turnéra, Támarix, Talinum, and a few species of Claytonia, the whole of this order consists of insignificant weedy plants, of no beauty, and little use. Claytónia perfoliáta and common purslane, which are occasionally used as salads, being the only species of a useful kind. They are chiefly herbaceous plants, frequenting dry barren situations, or the sea-shore of all parts of the world ; all are insipid and inodorous, and destitute, as far as is known, of medicinal properties. Some of the kinds of Támarix have an astringent tonic bark, and yield, when burnt, a large proportion of sulphate of soda. Turnéra resembles a Cístus.

224 Móntia W. \(\mathbf{5 3 7}\) Claytónia \(W\).
689 Teléphium \(W\).
1091 Portuláca \(W\).

1092 Talinum Haw.
11093 Limeum \(W\).
1036 Triánthema \(W\). 1037 Scleránthus \(W\)

690 Corrigiola W.
686 Turnéra \(W\).
685 Támarix \(W\).

\section*{Order LXXII. CACTI.}

All succulent plants destitute for the most part of leaves, the place of which is supplied by fleshy stems of the most grotesque figure; some angular, and attaining the height of thirty feet, others roundish, covered with stiff spines, like the hedgehog, and not exceeding the stature of a few inches. Their fowers are in many cases large and remarkably specious, varying from pure white to rich scarlet and purple, through all the intermediate gradations of colors. The species are chiefty natives of the hottest and dryest parts of the tropics, and are cultivable with little care, in pots filled with rubbish, in a dry-stove. Their fruit is fleshy and watery, and generally insipid, but it is eaten in their native countries for the sake of its refreshing moisture and coolness. Two species of Ophntia are hardy in Great Britain. The characters of this order and the next are very similar, although their habit is so widely different. Cacti are sometimes called Nopaleæ.
\[
1111 \text { Cáctus W }
\]

1112 Rhipsalis Gert.

\section*{Order LXXIII. GROSSULACEE.}

Distinguished from the last by the definite number of their stamens and woody leafy stems. The utility and excellence of the gooseberry and currant are known to every one. None of the other species equal these, although the fruit of several possesses considerable excellence. The berry of most of these is sweet, watery, and acid, but that of Ribes nigrum, and a few more, is tonic and stimulant, which appears to have some connection with the presence of glands upon the leaves of those species.

550 Ríves \(W\).

\section*{Order LXXIV. SEMPERVIVE平.}

Still another order of succulent plants, but with a habit very different from that of those which have gone before. The species are often characterised by the rosulate or densely imbricated arrangement of their leaves, but this is not by any means a universal character. They are natives, for the most part, of dry harren places in Europe, North Africa, and the Cape of Good Hope, and are cultivable with ease in pots of dry rubbish. Many of them have extremely beautiful flowers, especially those of the genera Sempervivum and Crássula, which are eitheı white, yellow, or deep rose color. Their leaves are used medicinally as refrigerant and abstergent; they are also, in a slight degree, astringent, and in Sédum ácre so acrid, that, taken internally,
they operate violently both as purgatives and emetics．The leaves of Sedum teléphium are occasionally eaten as a vegetable，but they are always found to leave behind a slight and unpleasant taste of burning．

696 \text { Arália } W . & 549 \text { Hédera } W .
\end{array}
\]

\section*{Order LXXIX．UMBELLIFER压。}

One of the least attractive groups of plants，and at the same time one of the most important to the world．They are not more useful as food than they are dangerous as poison；while in their native ditches they are often suspicious lurid weeds，but under the influence of cultivation they lay aside their venom，and become wholesome food for man．They are generally recognised by their hollow stems and cut leaves，with what botanists call a sheathing petiole ；that is to say，with a petiole，the base of which wraps round the stem． Their flowers are mostly white or greenish，rarely，as in Astrantia，some species of Caúcalis，and others，of a pink color．The inflorescence is umbellate，and their fruit consists of two ribbed portions，improperly called seeds，which are held together by a common axis，and a thickened discus．All are natives of damp ditches or way－sides，in cool parts of the world；in the tropics they are either extremely rare or wholly unknown，and when present，have generally a character unlike that of our European species．The simplicity of their structure，and uniformity of their appearance，has rendered their classification a matter of very great difficulty． It has been attempted in modern days by Lagasca，Sprengel，and Koch，all of whom have added something to our knowledge；but much still remains to be done．The arrangement of Professor Sprengel，objectionable as it is many points，is here adopted as the most perfect，upon the whole，of any yet published．The culinary and agricultural importance of many species is well known；the parsnep and carrot form a large part of the staple winter store of the inhabitants of Europe，as the Arracachas do of those of South America；and the Prangos of Thibet is supposed to be the most important and productive of any in the whole world，as a forage plant．The medicinal properties of Umbelliferæ are not more powerful than they are at variance with each other．While the seeds of some are aromatic，and stimulating in the highest degree，the fresh roots and leaves of others are not less narcotic．This has been supposed to arise from the difference in the state of the sap in different parts of the plant；and it has been thought that the narcotic principle is only to be found in the ascending sap，while the aromatic stimulant properties are found in the juices，which are fully elaborated and matured．It has been already observed，that their dangerous properties are often removed by cultivation；the common celery is a familiar instance of this；but the most remarkable，that of CEnanthe pimpinelloides，a most dangerous species when wild，which is cultivated about Angers for the sake of its roots， which are there called Jouanettes，and about Saumur，where they are known by the name of Méchons．The roots of some Umbellifere contain a large proportion of sugar；those of the carrot，when dried，more than an eighth；those of the parsnep just an eighth；and those of the chervil about eight parts in 100 ．Galbanum， Upopanax，and Assafcetida，are all the produce of different species of Umbelliferæ．

\section*{Order LXXX. RHIZOPHOREE.}

The mangroves are plants of arborescent stature, which are remarkable, in tropical countries, for growing upon the shores of the sea, even as far as low water. The seeds have the singular property of germinating, while enclosed within the capsule, and adhering to their parent, and pushing forth a long thread-like radicle, which lengthens till it reaches the soil, where it takes root, and forms a new individual. The bark of Rhizóphora gymnorhiza, which is very astringent, is used in India for dying black.

1078 Rhizóphora W.

\section*{Order LXXXI. HAMAMELIDEE.}

Hardy American deciduous shrubs, with the appearance of Amentacea, to which they are undoubtedly closely allied notwithstanding their situation here, which must be considered quite artificial. Nothing is known of their medicinal qualities.

1200 Fothergilla \(W\).
312 Hamámelis \(W\).

\section*{Order LXXXII, CAPRIFOLIACEA.}

This is an eminently beautiful order, consisting either of twining or erect shrubs with clusters of trumpetshaped fragrant flowers, or of fine bushes having cymes of white blosooms. The honeysuckle is the representative of the former, the dogwood of the latter. Here too is found the modest and delicate Linnæ'a, which, however inferior its attractions for the vulgar eye may be to those of its more ostentatious neighbours, yield to none of them in elegance or interest for the botanist. All the genera have a more or less astringent bark ; that of Lonicéra corymbósa is used in Chile for dying black; that of Córnus flórida in North America in intermittent fevers, as is also the bark of Córnus sericea, which, according to Barton, is scarcely inferior to Quinquina. The Elders are the link between honeysuckles and umbelliferous plants, to the latter of which they are allied by their stinking divided foliage and half herbaceous habit; their fowers are sudorific and soporific in a high degree, their leaves and inner bark are emetics and drastic purgatives, Triósteum perfoliátum is intermediate between this order and Rubiaceæ, with the former of which it agrees in its purgative, and with the latter in its emetic, qualities, which resemble those of ipecacuanha. All Caprifoliáceæ love shady cool places in both hemispheres; but few have been found in such as endure a very severe climate.

475 Lonicéra \(R . S\). & 478 Trísteum \(W\). & 679 Vibúrnum \(W\). \\
476 Symphória \(P h\). & 292 Linnæ'a \(W\). & 680 Sambúcus \(W\).
\end{tabular}

\section*{Order LXXXIII. LORANTHEA.}

None of these are cultivable; they are all genuine parasites rooting beneath the bark of the trees on which they grow, and deriving from their juices the whole of their nutriment. The Viscums have little or no beauty, but the Loranthi are among the most lovely of plants, hanging in clusters of rich scarlet flowers from the branches of trees in the tropics, which they often clothe with a beauty not their own. The misletoe of the Druids is supposed to have been the Loranthus europæ'us, the common Viscum never being seen upon the oak, while the Loranthus inhabits no other tree. If this be so, the latter must have once existed in this kingdom although now extinct. It has been suggested, that all vestiges of their religion were extirpated with the Druids, which will account for the Loranthus having disappearcd wherever that religion formerly held its sway.

2054 Viscum \(W\).

\section*{Order LXXXIV. RUBIACEE.}

Opposite entire leaves with intervening stipulæ, a monopetalous superior corolla, with a definite number of stamens and a bilocular ovarium, are the great characteristics of Rubiaceæ; an order of such extent that it embraces a very large proportion of the whole of phænogamous plants, including within its limits humble weeds and lofty trees, plants with important medicinal qualities and flowers of varied dyes, and herbs of neither value nor beauty as far as has yet been ascertained. The sections into which the order has been divided are merely artificial, with the exception of Stellatæ, which are the representatives of the order in northern regions. Among these the Rubia, or madder, is the most important on account of its dye; Galium also possesses some qualities of minor consequence, which have been already indicated in the body of this work. Anong the other sections, the plants of beauty or value are innumerable: of the former description, the genera Ixóra, Buuvárdia, Catesbæ'a, Portlándia, Coutárea, Gardénia, Mussæ'nda, Haméllia, Cephaélis, Cephalánthus, and many others, are notable examples; to the latter, every genus has a contribution of one kind or another. The root of Oldenlandia umbelláta is employed in India for staining nankin; that of Morinda umbelláta in the Moluccas, and of Morinda citrifolia in India, is used for dying red and brown. The potent febrifugal properties of the Cinchona need not be insisted on; it is less generally known that the bark of Pincknéya pábens, Macrocnémum corymbósum, Guettárda coccinea, and Portlándia grandifóra, possesses similar, but weaker powers. The bark and roots of Antirhóa are used, in the Isle of Bourbon, to stop hæmorrhage ; and that of Morinda Róyoc is used for ink. Astringent properties of a very marked character are found in the juice of Nauclea Gámbir of Hunter, and the Uncária Gambir of Roxburgh, both which are often improperly confounded with Gum kino, which is the produce of a very different plant. Some of the species formerly comprehended under the genus Cinchóna, but since separated by the name of Exostemma, possess strong emetic powers. The same qualities exist in Psychótria emética Cephaélis, Ipecacuánha,
and Psychótria herbácea，which are often used as ipecacuanha．The seed of the Coffea furnishes the valuable beverage which is so much esteemed in Europe and the East，under the name of coffee

Exotic weeds，nearly related to Rubiaceæ．Their properties are unknown．M．de Jussieu has remarked that their affinity to Valerianeæ is supported by the curious circumstance，that birds devour the young shoots of the Opercularias as they do those of the Corn－salads．

250 Operculária \(W\) ．
251 Cryptospérmum \(P\) ．S．

\section*{Order LXXXVI．VaLERIANE里．}

Small herbaceous plants，more interesting for the sake of their symmetry and neatness，than on account of any particular attractions：they may be considered a connecting link between Rubiacer and Dipsacea． Many of the Valérians，and all the Patrinias，are pretty plants．The Valerianéllas are useful esculents， known under the name of corn－salads．Their medicinal properties are of a decisive character．The roots of Valeriána officinális，Phu，and others，are bitter，tonic，aromatic，antispasmodic，and vermifugal； they are occasionally used as febrifuges．The odour of Valerian is not generally agreeable，but the Orientals collect with care，on the mountains of Austria，the roots of Valeriana céltica，with which they perfume their baths；and the natives of India，at this day，employ the Valeriana jatamánsi，the spikenard of old times，as a perfume，and against hysterics and epilepsy．
\[

\section*{Order LXXXVIII，CALYCERE压．}

Obscure weedy South American plants，differing from Compositz，chiefy in the position of their ovula． 1842 Acicárpa Juss．

\section*{Order LXXXIX，COMPOSIT压．}

A most extensive and natural order，obviously characterized by the cohesion of their anthere，and the arrangement of their florets in involucrated heads，or calathidia，as they are now called．Most of them may be said to be ornamental plants，and yet but a very few hold that station in the opinion of the public．It is difficult to account for this circumstance，nor is this the place to enter upon such an investigation；certain， however，it is，that with the exception of Dáhlias，the varieties of Chrysánthemum sinénse，and a few Calén－ dulas and Arctótises，and perhaps Tagétes，scarcely a single Composita now finds a place in a fashionable flower garden．The prevailing color of the flower in the order is yellow；red，purple，or scarlet，being com－ paratively uncommon．The species inhabit evexy part of the world，and in all，perhaps，in nearly equal pro－ portions：－in Europe and the north of the world they are chiefly herbaceous；but within the tropics，they are more frequently frutescent．Their medical properties are very important；Tussilágo fárfara，Chamomile， I＇nula，Solidágo Virgá́rea，Matricária Parthénilım，Stévia febrifúga，and Fupatórium perfoliàtum，are instances of the presence of tonic and febrifugal properties；Tanacétum and Santolina are anthelmintic ；Matri－ cária and the Achilléas emmenagogue；some Eupatóriums，Achilléas，Artemísias，and Caléndulas，are sudorific； certain Liátrises are diuretic，and Erigeron philadélphicum is both sudorific and diuretic．Ptármica and A＇rnica are sternutatory，and Spilánthes，Siegesbéckia orientális，A＇nthemis pyréthrum，and others，power－ fully excite salivation；finally，many Achilleas，Chamomile，Tanarétum，and Eupatóriums，are tonic and antispasmodic．Others seem to possess all these properties combined，and are reckoned among the best alexiterics，as the Ayapana of Brazil，and the Guaco of Peru．Every one knows the excellent and refreshing flavor communicated to vinegar by Tarragon：the same effects are produced in the Alps by Achilléa nána， Artemísia glaciális，rupéstris，and spicāta．Some species of Achilléa，Béllis，and Artemísia have been used as substitutes for tea．The seeds of many Compositæ，as Mádia and Verbesina，yield a copious oil；and the fleshy roots of Heliánthus tuberósus，a wholesome food for man．The juice of Lactuca virósa is highly narcotic，and has been even employed with extraordinary advantage as a substitute for opium．It is not necessary to men－ tion the utility of the leaves of the lettuce，the endive，the succory，the cardoon，or the roots of Scorzonera and Salsafis，as culinary productions；they must be familiar to all our readers；as also the fleshy receptacle of the artichoke and some other plants．The flowers of Echinops strigósus are used as a kind of tinder；those
of the artichoke, the cardoon, and others, have the power of curdling milk. The arrangement of Compositæ is attended with extreme difficulty; the greatest progress that has yet been made in reducing them to order has been with M. Cassini, by whom they are called Synantherex: but unfortunately, the remarks of that learned botanist are so scattered and unconnected, that the public has hitherto been able to derive little benefit from his labors. His general arrangement is here adopted, but for the reasons now given, his genera have not been enquired after, as, until they shall have been more completely systematized, the adoption of them would necessarily be full of errors, which would only add to the confusion that already too extensively exists. Those who wish to make themselves masters of this very interesting and difficult branch of systematic botany, should consult the Opuscules phytologiques of M, Cassini, and Mr. Brown's elaborate essay on the structure of Compositæ, in the Transactions of the Linnean Society.

\section*{Order XC. CAMPANULACEE.}

These differ from the last in not having the flowers in heads, in their usually distinct antherx, which are, however, syngenesious in Lobélia, in their polyspermous fruit, and also in exuding a milky juice. All the genera are pretty, and some highly ornamental. They are mostly herbaceous, and by far the greater number are extra-tropical, abounding especially in the woods and coppices of the North. The roots of Campánula Rapúnculus are used as a vegetable under the name of Rampion. The juice of some of the Lobelias is highly caustic and inflammatory; when taken internally, producing vomiting and even death: nevertheless, the root of Lobélia siphilitica, in small doses, acts as a diaphoretic, in greater quantity as diuretic or purgative, and, if taken in considerable quantities, as an emetic. An infusion of Lobélia inflata is used in North America as a remedy for leucorrhcea; and the root of Lobélia cardinális is employed in the same country as a vermifuge.

\end{tabular}

545 Cyphia \(W\).
547 Jasione \(W\).

\section*{Order XCI. GOODENOV1无.}

New Holland and South Sea herbs or undershrubs, very nearly akin to the last, from which they differ more in artificial characters than in habit. All of them are pretty, and deserving culture. Nothing is known of their properties.
\begin{tabular}{ll}
468 Goodénia \(R . B r\). & 470 Dampièra R. Br. \(\quad 473\) Scæ'vola \(R . B r\). \\
469 Eutháles \(R . B r\). & 472 Velléia Sm.
\end{tabular}

\section*{Order XCII, STYLIDEF.}

Like the last, the properties of this very small but curious order are, if any, undiscovered. All are inhabitants of New Holland, and either herbs or half-herbaceous shrubs. They have pink flowers, ornamented with glittering glands; their stamens are united into a column, which is terminated by a sessile stigma, and which is irritable in so high a degree, that, if touched with a pin, it instantly starts from its place with great elasticity.

1932 Stylídium R. Br.

\section*{Order XCIII. GESNERIEE.}

Fine tropical herbs, with broad, fleshy, downy leaves, and purple or scarlet flowers. They all require stove heat, and decayed vegetable soil; in their native country, which is chiefly equinoctial America, they are found growing in the woods, where the earth is little more than a bed of rotten leaves and bark.
\[
1290 \text { Gesnéria } W \text {. }
\]

1291 Gloxínia \(W\).

\section*{Order XCIV. ERICE厌.}

These are distinguished from the neighbouring orders by their polyspermous fruit, aristate anthers, and dry shrubby habit, Every genus is eminently beautiful, and worthy of the most assiduous cultivation. The first tribe is a native of hill-sides and open plains, chiefly of the extra-tropical regions of the earth. Some are famous for their beauty, some for their fragrance, and many for their foliage. The heaths are the glory of the Cape, the Arbutuses of Europe, the Andromedas of America, and Cléthra of the Canaries. The second tribe is distinguished from the rest by its inferior berry, and is not less valuable for its fruit than conspicuous for its beauty. The species are princ!pally North American. Monotropeæ stand in their systematic station as they grow in their native woods, lowly herbs among thickets of bushes and trees. Rhodoracer, once considered a distinct order, are chiefly North American; their flowers are less tubular than those of true Ericeæ; but their habit is not materially different; here the Azálea the Kálmia, and the Rhododéndron, the pride of European gardens, as they are of their native woods, find their station. The utility of the fruit of Vaccinium is well known; its bark is reckoned tonic, stimulant, and astringent, and their fruit slightly styptic. The berries of \(A^{\prime}\) rbutus úva-frsi are considered lithontriptic; its leaves have also been employed successfully in infusions in obstinate cases of gonorrhœea. Extract of Chimáphila umbelláta, in the form of pills, in doses of five scruples a day, has been found successful in cases of dropsy. Some of the species are possessed of narcotic qualities; this is the case with Lédum, Rhododéndron chrysánthum, and especially Azalea póntica; honey obtained from the juice of which is said by Xenophon, to have caused the death of many soldiers in the famous retreat of the ten thousand. An infusion of Rhododendron máximum is used in America in cases of chronic rheumatism, and that of Rhododéndron pónticum in Asia, against gout and rheumatism.

\section*{Subclass III. COROLLIFLORA.}

Petals cohering in the form of a hypogynous corolla, which is not attached to the calyx.
To this subclass are to be referred all genera which have a monopetalous corolla, with the stamens inserted into it, and a superior ovarium.

\section*{Order XCV. MYRSINEE}

Showy shrubs, with evergreen undivided leaves, and cymes of white or red flowers. Theophrásta is a very rare stove plant, with a simple stem, and undulated spiny toothed leaves. The Ardisias are common in collections. None are natives of Europe, but are found in the hot parts of Asia, Africa, and America. Nothing is known of their properties.

408 Theophrásta L.
4.35 Ardísia W.

443 Bæobótrys J'ahl.
409 Clavija Fl. per.

\section*{Order XCVI, SAPOTEÆ.}

These are also shrubs, which are mostly evergreen, and natives of the warmer regions of the world. Some of the Bumélias are found in the southern states of N. America, but none of the order exists in Europe. They are chiefly valuable for their fruit, which, in many cases, contributes richly to the dessert Mimusnns eléngi, Imbricária malabérica, Sideróxylon spinósum, are all of this description; the star apples of the West Indies, the produce of several species of Chrysophyllum, and particularly of C. cainito, are esteemed delicious; and the Medlars, Lucumas, and Sapotillas of equinoctial America, all the fruit of different kinds of A'chras, are among the most valuable productions of the western world. The seeds of all the order are oily: those of \(A^{\prime}\) chras sapóta are accounted diuretic and aperient. Their oil is not fuid, but so concrete as to have the appearance and consistence of butter, whence the name of butter-tree has been applied to different species both in Africa and India. The most famous of this description is the Indian mava, mahva, or madhuca, the Bássia butyrácea of botanists; the seeds of which are so oleaginous, that a single tree has been known to produce three quintals of oil; the dried fowers of the same tree are mixed by some Indians with their food, and a kind of spirit is distilled from them by others. The juice of all the sapotas is milky, but not acrid and poisonous like that of most other lactescent orders, but, on the contrary, yielding a wholesome beverage or food. Here is supposed to belong the famous Palo de Vaca, or Cowtree of South America, the trees of which are regularly milked by the inhabitants of the districts in which it grows. According to Brown, the bark of some of the \(\mathbf{A}^{\prime}\) chrases is so astringent and febrifugal as to be substituted for quinquina.

\section*{Order XCVII. SYMPLOCACE.}

Shrubs with serrated leaves, turning yellow in drying, and small white flowers which are sometimes fragrant. The leaves of most of them are astringent; those of Alstonia tinge the saliva greenish yellow, of Symplocos tinctória are used in America under the name of Sweet-leaf, for dying yellow.

1614 Sýmplocos \(L\).

\section*{Order XCVIII. EBENACEF.}

Some of these are hardy trees or shrubs, with deciduous leaves and white flowers, natives of woods, mountains, and banks of streams in North America and Europe; others are tropical evergreens. Among the former, the best known are the Snow-drop tree, or Halési, with pendent shewy white blossoms; and the different species of Styrax: of the latter, many of the Diospyruses' produce are eatable fruit; as, for example, the Mabolo of the Phillippine Islands, which is as big as a peach, and the Kaki of Japan, which resembles an apricot. All these fruits are remarkable for their extreme austerity before maturity, and the necessity of letting them decay, like our medlars, before they are fit for table. These are also distinguished for the excessive hardness of their wood, and for the black colour it sometimes acquires when old, as the Ebony. The bark of Diospyros virginiana is used in North America in intermittent fevers.

\section*{Order XCIX. OLEINÆ.}

The olives are known by their monopetalous corolla, with a valvular æstivation, two stamens alternate witi. the segments, a bilocular ovarium with no discus at the base, and pendulous collateral ovula. They were formerly combined with the jasmines. They have all simple opposite leaves; their flowers are either white, yellow, or purple, and frequently fragrant. The Phillyréas are anong our finest evergreens, and the Lilac or Syringa perhaps at the head of hardy deciduous bushes. The ash is an anomalous genus which hardly belongs to the order. The seed of the olive contains so large a proportion of fixed oil, that it has long been one of the most important objects of cultivation in the South of Europe. The bark and leaves of many Oleinæ are bitter and astringent ; these properties are particularly apparent in the ash, which has often been employed successfully as a febrifuge. From the exudation of many species of that genus, the mild purgative called manna is formed; it is most commonly found upon the \(O^{\prime}\) rnus. M. Decandolle remarks, that in proof of the natural affinity of the plants here combined, and of the propriety of separating the jasmines from them, it has been found that all the olives as now restricted, will bud or graft upon one another, but not on the jasmines. Thus the lilac will graft on the ash, the Chionánthus, and the Fontanésia, and even upon Phillyréa latifólia, and the olive will take upon the Phillyréa, and even on the ash.

\section*{Order C. JASMINE压,}

Fragrance is the predominant property of the jasmine, and has made it for ages the favourite of poets and of the people; this arises from the presence of an oil which can be extracted so as to retain its perfume. In medicinal qualities, the jasmines do not differ materially from the last; they are neatly distinguished by botanists by the direction of their ovula which are erect in Jasmineæ, and pendulous in Oleinæ.

38 Nyctánthes \(W\).
39 Jasminum W.

\section*{Order CI. APOCYNEÆ.}

We now turn from the contemplation of plants endued with mild and agrecable properties and fragrant flowers, and often bearing food for man, to others which are among the most dangerous and fatal poisons; whose juices, milky indeed, like the Cowtree, are not a wholesome and delicious beverage like those of Sapotex, but on the contrary acrid, caustic, or bitter. They are readily known by the twisted direction of the segments of the corolla, which have been compared to the rays of a Catherine's wheel, whence they were called by Linnæus, Contortæ. By far the greatest part of the order consists of tropical trees and shrubs : a few Apócynums, Amsónias, and Vincas, are natives of the colder zones of the earth. Many are elegant climbers, as the different species of Echites and Melodinus. The sptendid Oleánder belongs to Nérium; the different species of Plumiéria, Camerária, Strophánthus, and Arduina are stove plants of the greatest beauty. The medicinal action of these plants is highly powerful. The Strychnos, or nux vomica tree, is remarkable for its bitterness and acrid deleterious effects, which are indicated not only when introduced into the stomach, but still more violently rhen absorbed into the system by inoculation. In gencral, the Apocyneæ are acrid, stimulating, and astringent ; these principles, when in excess, act so powerfully on the nerves as to prociuce stupefaction. The root of Ophioxylon is very bitter and purgative: under the name of snake-root it is used in India as an antidote to the bites of serpents. The bark of Cérbera Mánghas is purgative; of Echites antidysentérica, and the Wrightia of the same name, astringent and febrifugal; the leaves of the Vinca are so astringent, that they have been used successfully in tanning; those of Nérium oleánder are said to abound in free gallic acid. The inspissated juice of a species of Cérbera, known in Mexico under the name of Ycotli, is a fatal poison.

\section*{Order CII. ASCLEPIADEE.}

These differ from the last only in having the stamens united into a sort of fleshy crown, and the poilen coherent in masses of a waxy substance like that of Orchidea; their properties, habit and geographical range, are much the same. Periplóca is a singular instance of an asclepiadeous plant being a hardy shrub, every other frutescent species of the order being natives of countries where frost is unknown. Hoya comprehends climbing plants, with waxen, clustered, odoriferous fowers distilling honey. Pergularia is valued for its fragrance, Ceropégia for its singularity, and Asclénias for beauty and hardiness. But the most extraordinary genera of the order are Stapélia, Piaránthus, and Huérnia, in which the place of leaves is supplied by fleshy short stems of various forms, and whose flowers are not less singular for their curious and complex organization, than they are remarkable for their strange coloring and spotting, and offensive for their foetor. The root of Gymnéma vomitorium, Asclépias curassávica, Calótropis prócera, and some others, is employed in different countries for ipecacuanha. An infusion of the root of Asclépias decumbens has the singular property of exciting general perspiration; whence it is successfully used in Virginia for pleurisy. It is very singular that, in a tribe of plants so generally poisonous as these are, the young shoots of some species should be an article of food: of this nature are Pergularia édulis, Periplóca esculénta, Apócynum índicum, and several more.

\section*{Order CIII. GEN'TIANEX.}

An order in some degree intermediate between Polemoniaceæ and Scrophularineæ, from both which it is distinguished both by habit and fruit; some of the genera border closely upon Apocyneæ. The species are natives of cool or mountainous regions or pools in all parts of the world. The Gentians are mostly dwarf herbaceous plants, with deep blue flowers; the latter color, and different shades of orange, being the prevailing hues. They are all pretty, and many beautiful in the highest degree; but, with a few exceptions, they are impatient of cultivation. The medicinal properties of the root of Gentianalítea, rúbra, and purpúrea, are eminently tonic, stomachic, and febrifugal ; their bitterness is second only to Quássia. Similar, but more feeble virtues, are found in most of the order, especially in Villársia ováta, Gentiána peruviána, Chirayíta, Fraséra Wálteri, \&c. Spigélia anthélmia is used as a vermifuge; and the root of Spigélia marylándica infused in water as anthelmintic, and in wine as febrifuge. Potália amára is used in Guiana as an emetic. A kind of spirit is distilled in Switzerland from the roots of Gentiána, macerated in water.

\section*{Order CIV. BIGNONLACEE.}

The showy trumpet-shaped flowers and broad leaves of these plants, render them objects of general adimiration. The greatest number is found in the equinoctial regions, a few only passing beyond those limits to the north. Bignónia radicans is a hardy climbing plant, of exceeding beauty; and the Jacarandas are resplendent with flowers of blue or purple, and leaves which emulate the elegance of the Acacia. Nothing important is known of their qualities. Their wood is said to resist the attack of worms.

64 Catálpa Juss.
\(129 \pm\) Bignónia \(W\).
1295 Jacaránda Juss.

\section*{Orber CV. COBÆACE玉.}

A climbing genus with large purple flowers, recently separated from the Bignonias by Mr. Don. Nothing is known of its medicinal properties.

388 Cobx'a Cay.

\section*{Order CVI. POLEMONIACE E .}

Herbaceous plants with showy blue, red, or white flowers, and often with pinnated leaves. They are natives of cool or mountainous parts in Europe and America. Nothing is known of their properties.

369 Phlox \(W\).
70 Polemónium \(W\).
389 Cántua \(W\).
390 Hoítzia Cav.

\section*{Order CVII. CONVOLVULACEÆ.}

Nearly the whole of these are twining plants, with shewy flowers expanding beneath the infuence of bright sunshine. A few are shrubs, but the greater part are herbaceous, and very many annual. They are frequently, also, weeds, which, from their creeping roots, are difficult to extirpate. All parts of the world produce them, from the cold regions of the north to the burning soil of the equator. Cuscuta is a singular parasite, wholly destitute of leaves. The root of many is filled with a milky acrid juice, which is very purgative. Scammony, jalap, and some other drugs, are the produce of Convolvulacea. The root of Convólvulus fóridus and scopàrius, and Ipomæ' a quamóclit, is stimulatory; that of Convólvulus batátas, which is the sweet potato of America and Southern Europe; and Convólvulus édulis are wholesome articles of food.

Hydrolez are little known, pretty, herbaceous plants, mostly with blue flowers, native both of cold and tropical countries; Diapénsia lappónica being an inhabitant of Lapland mountains, and Hydrólea spinósa of West Indian marshes. Their botanical characters are very nearly the same as those of Polemoniacee. The roots of Hydrólea spinósa are reputed bitter, and slightly purgative.

\section*{Order (VIII. BORAGINER}

True Boraginex are chiefly herbaceous plants, with alternate exstipulate leaves, the surface of which is covered over with minute asperities, and with flowers arranged in one-sided spikes or racemes, occasionally solitary. Each flower has also four distinct little nuts or seeds, as they are commonly called. Some E'chiums
and a few more are shrubs．They are found abundantly in Europe，Siberia，and the North of Africa，less commonly in India，and the equinoctial parts of the world；in some quantity in North America，and in tolerable abundance in Now Holland．Within the tropics the order is principally represented by Heliotrópiums and Tournefortias；in colder latitudes by Anchúsas，Cynoglóssums，herbaceous E＇chiums，and the like． Some are mere weeds，quite unworthy of culture；others are eminently beautiful，as many E＇chiums， Onósmas，Onosmódiums，Sýmphytums，and others．In general they are mucilaginous and emollient，qualities which are especially abundant in the root of Symphytum and Cynoglóssum．Pure nitre has been found in several plants of the order．A red color is given out by Anchisa tinctoria，Lithospermum tinctorium，and Onósma echioides，which is used in dying．Several plants are employed on the same account in America．The Hydrophylleæ are often considered as distinct，on account of their capsular fruit and cartilaginous albumen． One or two of these are pretty plants，but most of them mere weeds．

\section*{Order CXIIJ. LABIATÆ.}

A portion of Diandria Monogynia, and the whole of Didynamia Gymnospermia of Linnæus, make up Labiatæ, which are characterized by their didynamous stamens, four little nuts or naked seeds, single style, and irregular corolla. They are mostly natives of extra-tropical countries, although under the form of Hýptis, Anisoméles, Leacas, O'cymum, \&c., they are found in the hottest zones of the world. Many are extremely odoriferous in the leaves, some bear handsome flowers, but by far the greater part are no better than weeds. They are all remarkable for their tonic, cordial, and stomachic virtues: they contain both a bitter and an aromatic principle, in different proportions. The bitterness which is given out in decoctions, resides in a gumresinous secretion, abounding in some Teúcriums, which are particularly employed as stomachics, and sometimes as febrifuges : those which abound in essential nil, and which are consequently aromatic, are used as stimulants. From the different degree of combination of these principles in different plants, they have obtained various uses; such as savory, thyme, marjoram, for seasoning of food; sage, balm, ground ivy for tea; marum, marjoram, lavender, and thyme, for sternutatories; others, such as lavender, mint, balm, and rosemary, for perfumes. It is a remarkable fact, that the essential oil of all contains camphor, which exists in such quantity in sage and lavender, that it has been supposed that the separating of it might become an object of commerce.

\section*{Order CXIV. PEDALINE.}

Herbaceous plants, formerly included in Bignoniaceæ, from which they are distinguished by the small number of seeds in each cell of the fruit. Natives of the tropics, with shewy trumpet-shaped fiowers. 'Ihe seeds of Sésamum abound in oil, which is easily expressed, for which the common species is extensively cultivated in hot countries.

1296 Sésamum W.
1300 Martýnia \(W\).
1331 Pedálium W.

\section*{Order CXV. MYOPORINERE.}

South Sea and New Holland shrubs, with scarcely any hair. The leaves are simple, alternate, or opposite, with no stipulæ. The flowers, scarlet, white, or blue, axillary without bractex. These are very near Verbenaceæ. Stenochilus is the handsomest genus of the order: the Avicénnias are shore plants, growing in the place of the mangroves, and shooting their long roots to a great distance among the mud, sometimes to the length of six feet along the surface before they fix themselves. Their medicinal properties, if any, are unknown.

1323 Avicénnia L. 1332 Myopórum Forst. 1333 Stenochilus R. Br. 1334 Bóntia R. Br.

\section*{Order CXVI. VERBENACEE.}

A mixture of weeds and shewy herbs, of humble creeping plants and of lofty timber trees. Some of the Vítexes and Clerodéndrums are handsome shrubs: Aloýsia is esteemed for the fragrance of its flowers, and Holmskióldia for the refulgent scarlet of its enlarged calyxes. Téctona produces the famous Indian teakwood, No properties of consequence have been attributed, by medical men, to any plant of the order, those formerly ascribed to the vervain and chaste-tree being now disregarded. The species are natives of waysides in Europe, and of woods and barren plains in the tropics.

\section*{Order CXVII. ACANTHACE \(\mathbb{C}\).}

These are known by the elastic dehiscence of their capsules, and the hooked processes of the seeds. They are almost entirely tropical herbs or shrubs, with the pubescence, if any, simple or capitate, but never stellate. Their leaves are opposite, occasionally arranged in fours, simple and undivided, or very seldom lobed. The flowers are either in imbricated heads or open racemes, always enclosed in their bracteæ; and are white, blue, yellow, scarlet, or purple. Some of the species are very shewy, but few of them are cultivated commonly; a large proportion are mere weeds. The Thunbergias are fine climbers, and the Acanthus móllis, the foliage of which gave rise to the classical acanthus of architecture, is, perhaps, except Morína pérsica, one of the most interesting of hardy herbaceous plants. It is also one of the few species to which any medical properties are ascribed, being used sometimes as an emollient by reason of its mucilage. Justicia biftora is employed in Egypt as a poultice, J . Ecbólium as a diuretic, and J . pectorális as a vulnerary.

\section*{Order CXVIII. LENTIBULARIE.}

Very pretty interesting aquatics, which are scarcely susceptible of cultivation, except in a few cases. The Pinguiculas are either European or North American, inhabiting elevated patches in bogs: the Utriculárias are floaters, found in most countries in marshes and little rills: their fowers, are white, yellow, or blue.

53 Utriculária \(W\).

\section*{NATURAL ARRANGEMEN＇：}

\section*{ORDER CXIX．PRIMULACEE．}

Beautiful dwarf herbs，inhabiting the mountains and meadows of all parts of the world，but especially in the northern hemisphere．Nothing can be more lovely than the little delicate alpine Primulas，Androsáces， Arétias，and Soldanéllas，with their little modest blossoms，sometimes rivalling the whiteness of the surround－ ing snow，sometimes emulating the intense blue of the empyrean，as if the one had borrowed its hues from heaven，and the other from the spotless mantle of the earth．Hottónia is a naiad of the stream，inhabiting several parts of England，in ponds and ditches，which are enlivened for many a month with its rosy flowers， peeping from among the sedge and under grass，by which it is environed．All the genera are familiar to gar－ deners，except Centúnculus and Schwénckia，of which the former is singular in the order，as being an obscure minute weed，and the latter has inelegant green flowers，curious to the botanist but ungrateful to the florist． The prominent botanical character is the one－celled fruit，with a central placenta，and the stamens opposite the petals．The properties of Primulaceæ are feeble and of little consequence；they appear to be slightly astringent and bitter ；the root of Cyclamen is acrid，and only eaten by wild boars；the flowers of the primrose and cowslip are fragrant，and mildly sudorific and soporific．Cortúsa Mathiola has been used in nervous disorders．

\section*{Order CXX．GLobularine．}

Pretty alpine plants with blue flowers．The leaves of Globularia A＇lypum are very bitter and powerfully purgative，giving at the same time a tone to the stomach and intestines．

260 Globulária W．

\section*{Order CXXI．PLUMBAGINE压．}

These are properly placed at the limit between Monochlamydeæ and Dichlamydea，to either of which they are referable in the minds of some botanists，although it appears，upon the whole，to be most convenient to station them where they are now arranged．They are low shrubs or herbaceous plants，with shewy red or blue flowers of an arid texture，inhabiting salt marshes and subalpine tracts，in the temperate latitudes of both the northern and southern hemispheres．All the Státices and Armérias are fine plants worth culti－ vating．The root of Státice Limónium is astringent and tonic ；of the Plumbágos，the root and whole plant are acrid and caustic，and employed as vesicatories．

324 Plumbágo \(W . \quad 705\) Arméria \(W\) ．en． 706 Státice \(W\) ．en．

\section*{Subdivision 1I．MONOCHLAMYDE E．}

\section*{Perianthium simple．}

The absence of corolla characterizes this subdivision of dicotyledonous vegetation；but as the term corolla is subject to frequent misunderstanding，it should be borne in mind，that whenever there is only one foral envelope，that envelope is to be considered calyx，whether green，as in most cases，or colored，as in the Marvel of Peru．

\section*{Order CXXII．PLANTAGINEÆ．}

Little inconspicuous herbs found in waste places all over the world．The leaves are stellate，and occasionally ternate；the pubescence is jointed；the flowers are brownish，and arrayed in dense spikes．Their leaves are rather bitter and astringent；their seeds mucilaginous and rather acrid；those of Plantágo arenária are imported in large quantities from the south of France，for the purpose of forming an intusion in which mustins are washed． \(\mathbf{P}\) ．média is sometimes cultivated by farmers under the name of ribgrass．

278 Plantágo \(W\) ．
1967 Littorélla \(W\) ．

\section*{Order CXXIII．NYCTAGINEA．}

With the exception of Mirabilis，in which the colored calyx has a shewy effect，all the order consists of weeds，growing often among the loose sand on the sea coast of the tropics and western hemisphere；none are found in Europe．The Abrónias are curious，neat，and often fragrant．The root of Mirâbilis Jalápa was formerly considered the jalap，which is now known to be an error；it is however purgative，although in a less degree．Boerhaávia tuberósa is also a reputed purgative．
29 Boerhávia W． 81 Calyménia R．P． 322 Mirábilis \(W\) ． 323 Abrónia Juss． 864 Pisónia W．

\section*{Order CXXIV．AMARANTHACEA．}

Epon this order Dr．von Martius has the following remarks：Leaves，especially when young，of a lax soft texture，abounding in saccharine，mucilaginous，and fibrous particles，and therefore fit for food．The seeds are farinaceous，consisting chiefly of starch and mucus．Their virtues are nutritive，emollient，demulcent； the root of Gomphrena officinális is tonic and stimulant．The species are either gregarious or solitary； mostly diffuse and villous，and existing in dry stony exposed places，or erect and reclining on other vegetables， with little pubescence，when found on the skirts of ancient forests；a few are found in saline coast places； finally，they are more cummon in low land，little elevated above the surface of the sea，than in mountainous regions．They are met with in both hemispheres；rarely under the equator，but increasing both north－ wards and southwards as we recede from them；they are confined to no countries in particular，but are found to affect all regions of the world．Among an abundance of weeds，we distinguish a few five plants deserving cultivation，as the Globe Amaránthus，the Cockscombs，and a few species of A maranthus，one of which，under the name of Love－lies－bleeding，is commonly yeared for the sake of its long，tail－like，pendent masses of crimson flowers．Amaránthus oleráceus，and a few others，are occasionally cultivated as potherbs．

559 Anýchia Mich． & & &
\end{tabular}

Order CXXVI，CHENOPODE压。
The habit of this order is a better distinction from Amaranthaceæ，than any artificial character which it is easy to point out．While Amaranthacex have a dry perianthium with a dense inflorescence，Chenopoder on the contrary have a fleshy perianthum and a very effuse inflorescence．In the former，the stamens are usually
inserted under the ovarium ; in the latter into the calyx, but this mark is not constant. None of them, unless Phytolacca is excepted, can be esteemed plants of ornament; on the contrary, they have a weedy uninviting appearance, which is not improved by the fetid smell of some of them. But, although their appearance is less attractive than that of the Amaranths, their use to man is far more considerdble. Their qualities are very various; Camphorósma has the smell of camphor; Petivéria stinks like onions; Phytolácca roots, leaves, and berries, are violent purgatives and emetics; the latter are esteemed in North America nearly equal to Guaiacum, and are employed in chronic rheumatisms, and in rheumatic pains following venereal diseases; an extract of the berries has been employed in scrophula and cancerous ulcers; and the young shoots of the plant are eaten in the United States as asparagus. Some of the Chenopódiums, as Ambrosioides, Bútrys, \&c., possess antispasmodic and tonic properties; the leaves of Spinácia, and of many Chenopódiums, are eaten as spinach; as are those of Basella in China and India. Salsola and Salicórnia are often employed as pickles. Beet roots are equally valuable as a culinary and agricultural production, and the leaves are an excellent vegetable when boiled. But the most remarkable feature in the properties of the order is the abundant production of soda, which is obtained from many of the species, as from all the Salsólas, Salicórnias, Anabásis, many species of A'triplex, several salt marsh Chenopódiums, and others. The seeds of Chenopódium anthelminticum are used as a vermifuge, those of \(A^{\prime}\) triplex hortensis excite vomiting, frequently attended with acute pain; those of Chenopódium quinóa are said to be used as rice. To conclude this list of remarkable properties in one of the most vile of all assemblages of plants, the roots of beet yield an abundance of sugar.

\section*{Order CXXVII. POLYGONE E}

Herbaceous or suffrutescent fleshy-leaved plants, chiefly natives of the northern hemisphere; a few Polygonums and Coccolbbas are found to the south, the former in barren places, the latter on sea shores. A great part of the order consists of worthless weeds. Some of the Polygonums, and all the Eriogonums, are handsome plants; the Rheums are famous in medicine. The root of Rheum is tonic and purgative; most of the Rúmexes and Polýgonums are also tonics. The juice of the Coccolobas is very astringent. The young leaves and shoots of several species of Rímex and Rhéum are eaten either raw or baked, under the name of sorrel, French sorrel, and tart rhubarb. For the sake of its seeds, Polýgonum Fagopyrum is cultivated by farmers under the name of buck-wheat; the seeds of \(P\) : aviculáre are very emetic and purgative. The flesliy calyx of the Coccolobas is colored; and, the fruit growing in clusters, the genus has received the name of the sea-side grape.

88 Atraphaxis \(W\).
856 Rúmex \(W\).

857 Oxyria Dec.
y22 Coccolóba \(W\).

937 Eriógonum Mi.
1052 Brunnichia \(W\).

1106 Calligonum \(W\)
2000 Triplaris \(W\).

\section*{Order CXXVIlI. BEGONIACEI.}

The acid qualities, sheathing stipules, and alternate leaves of these tropical herbs approximate them to Polygoneæ, notwithstanding the very different structure of their fructification. Most of the species are pretty, some very handsome; all requiring great heat and humidity to be grown in perfection.

1989 Begónia \(W\).

\section*{Order CXXIX. LAURINEE.}

Noble trees or shrubs with handsome foliage and inconspicuous flowers. They are chiefly natives of hot countries, where they constitute some of the most valuable of the productions known under the name of spice. By botanists they are readily recognized by the singular circumstance of their anthers having each four cells, the valves of which are hinged as it were to the upper edge of each cell, and do not open longitudinally like those of most other plants. It is well known that the cinnamon is the produce of the Laírus cinnamómum, and that its properties are eminently aromatic, warm, and stomachic. The same peculiarities, but in a less degree, exist also in Laúrus cássia, L. malabáthrica, and L. culilában, which are all occasionally substituted for true cinnamon; they are found in the leaves of Lairus parvifólia, in the bark of the species which produces the Pichurim bean; ir that of L. cupuláris, which is the Isle of France cinnamon; of L. quixos, which yields the Peruvian cinnamon ; in L. Benzoin, which was used as spice in the United States during the American war; and finally, in the common bay tree of our plantations. Laúrus sassafras yiells the sassafras chips of the shops, but its bark is much more powerful. The fruit of many Lauriner are extremely aromatic; that of Laúrus Pérsea is an agreeable West Indian fruit, called the alligator pear. Camphor is the produce of Laurus cámphora, and of another or two; this substance is found indeed in small quantities in the roots of almost all the order; one of the cinnamons is even named Capuru Carundu, which signifies camphorated cinnamon.

954 Laúrus \(W\). 936 Cassýtha \(W\). 1942 Hernándia \(W\). 1077 Agathophýllum W.

\section*{Order CXXX. MYRISTICEE.}

Closely allied to the last, especially in sensible properties. The arillus of Myristica is the mace of the shops, and its nut, the famous nutmeg. It is well known that this abounds with oil ; in Viróla sebifera the oily secretion is so copious, that it is readily separated by immersion in boiling water under the form of fat.

2120 Myrística \(W\).

\section*{Order CXXXI. PROTEACEE.}

Favorite shrubs with gardeners, both on account of the neatness of their foliage and the beauty of their flowers. With very few exceptions, they are confined to the southern promontory of Africa, and to New Holland, where they adorn large tracts of country. They are shrubby or arborescent plants with an arid habit. The leaves are simple, evergreen, narrow, entire or serrated. The flowers generally grow in clusters, and are green, yellow, or red, sometimes in true Proteas surrounded by colored bracteæ with dark hairy margins. Their stamens are four, with distinct anthers, which rarely adhere together. The pollen is triangular; the stigma undivided and usually oblique. Their fruit is of various kinds, either a solitary nut or a sort of cone consisting of many nuts immersed among the indurated remains of abortive flowers. Of their properties, little is known. Some of the Rhópalas afford tolerable timber; the bark of Prótea speciósa and grandittora is astringent and useful in diarrhoeas. The seeds of Embóthrium tinctórium yield a powder which is employed for dying pink. The Próteas of the Cape, and the Banksias and Dryandras of New Holland, are the finest plants of the order.

\section*{Order CXXXII. THYMELEE.}

Nearly all shrubby plants, found in all parts of the world, but most abundantly in the south of Africa, The flowers are white. yellow, or red, most commonly in clusters, and often fragrant; the foliage is entire, either smooth or silvery, and generally very neat. Their wood is particularly soft; their inner bark easily separable, and in Dáphne Lagetta, pulls out by the division of the vertical fibres into a sort of network resembling lace. Their bark is extremely acrid, acting as a vesicatory when applied to the skin, and if chewed, producing extreme heat and torture in the mouth; a decoction of it has been used with some success in venereal diseases. The seeds of these plants are poisonous to man, but birds eat them with impunity. The fibres of Dírca and Lagétta are used for cordage; those of Dáphne gnidium and Passerína tinctória are employed in the south of Europe for staining wool yellow, which is converted into green by the addition of Isátis.

2141 Fusánus \(L\).
2162 Hamiltónia W.

\section*{Order CXXXIV. ELexAGNEA.}

Hardy shrubs or small trees, with deciduous leaves, covered, as well as the bark, with minute silvery scales: their flowers are inconspicuous, but sometimes agreeably fragrant. They occupy but little space; a few inhabiting China and Japan, and the remainder Europe, North America, and Guiana. The berries of Hippóphae rhamnoides, which are slightly acid, are used as a kind of sauce by the Swedes.

259 Elæágnus \(W\).
2057 Shephérdia Nutt.
2058 Hippóphae W.

\section*{Order CXXXV. ARISTOLOCHIÆ.}

Here vee are on the limits of Monocotyledones and Dicotyledones. The species are herbaceous or half shrubby plants, with simple, often reniform, leaves ; and mottled grotesque flowers, usually brownish purple. Their roots are all bitter, and possessed of tonic and stimulating properties; but the degree in which they exist in different species is not at present ascertained. The Aristolochias have been in former days praised as emmenagogues, and many are still used in South America as a remedy for the bite of serpents. A'sarum europa'um is a purgative and emetic when fresh, but its powers are much diminished by drying; its dried leaves are occasionally used by the country people in some parts of England as a sternutatory.

1072 A'sarum \(W\).
1934 Aristolóchia \(W\).

\section*{Order CXXXVI. EUPHORBIACE压.}

Weeds and lofty trees, of such varied appearance and property, that it is scarcely possible to frame a brief character by which they can be expressed. Their vegetation in cold countries is mostly herbaceous, in hot cuuntries frutescent or arborescent; their juice is milky, and their flowers mostly inconspicuous. It is for their medicinal properties that they are chiefly known, and these are as various as their aspect; mostly, however, dangerous, and always to be suspected. In a few of them, the smell and taste are aromatic; but in most, there is either no smell or it is nauseous, and the taste constantly acrid and pungent. Some possess also an acrid limpid fluisl, which is given out by the leaves when touched. Many of them act strongly upon the kidneys, as several species of Phyllánthus, the leaves of Mercuriális annua, and the root of Rícinus commanis. Many are said to be powerful medicines in cases of dropsy. The bark of several Crótons, the wood of Crôton Tiglium and Buxus, the leaves of the same, and also of Cicca disticha, several Euphorbias, and others, are recorded as sudorifics, and useful against syphi'is; as emetics, we find the roots of the Euphorbias, the juice of Cómmia, A'nda, Mercuriális perénnis, \&c. A great number are purgative, especially the leaves of Búxus and Mercuriális, the juice of Euphórbia, Cómmia, Húra, the seeds of Ricinus, Cróton Tiglium, A'nda, and Jatropha. The effects of some others are so dangerous, particularly Hippómane, that it is not advisable to administer them even in very small doses; even in many Euphórbias it is difficult to draw a line between the quantity in which they are poisonous, and that in which they are harmless or useful. The nature of their poison is mostly acrid, occasionally, however, mixed with something narcotic, as is apparent from the effect of those which are used for poisoning or rather stupifying fish. The purgative oil in which the seeds of many are found to abound, has been determined to reside wholly in the albumen; bence the embryo of some, as Omphálea diándra, is eaten as nuts. Boiling or roasting has also the effect of dissipating their noxious effects; thus Játropha Maníhot, than which there scarcely exists a more dangerous poison, affords a food when submitted to fire, called cassava, the flour of which is often used in London as a luxury for making puddings, than which few are reputed to be more wholesome. But the most curious of all the products of Euphorbiacea is the Caoutchouc, that singular substance which, although the produce of dangerous acrid trees, possesses nothing whatever which has been found capable of acting upon the buman system in whatever way applied, which is unalterable either in air, in water, or in spirits, although it softens at a high temperature. It is chiefly produced by Siphónia elástica, but also exists in the juice of very many others, as Excacária Agallócha, Hippómane Mancinélla, Híra crépitans, Sápium aucupárium, Plukenétia volúbilis, the Játrophas, Mábea, Ompháleas, and many others. Tournesole, another curious chemical preparation, is the juice of Croton tinctórium, but is also found in several others. Many other properties belong to this order, which it would be too long to detail in this place. The curious reader will find ample information in the medical division of 31. Adrian de Jussieu's monograph of the order, from which most of the foregoing remarks are taken.

Weeds of no interest, except the Réseda odoráta for its delicious fragrance. R. lutéola, a common annual in waste places, yields a yellow color fit for dying.

1102 Réseda \(W\).
2099 Datisca \(W\).

\section*{Order CXXXVIII. CALYCANTHEE.}

Handsome grateful deciduous shrubs, with deliciously fragrant flowers, natives of North America and Japan. They are not known to possess any medicinal virtues, but their odour insures them a place in every garden, notwithstanding the uninviting look of the blossoms themselves.

1157 Calycánthus \(L\).
1158 Chimonánthus Lindl.

\section*{Order CXXXIX. ATHEROSPERMEJ.}

Allied to the last in sensible and botanical qualities : they are shrubs, natives of America and New Holland, of which little is known either to gardeners or botanists.

2103 Pełtmus Pers.

\section*{Order CXL. EMPETREAE.}

Dwarf heath-like shrubs, with obscure flowers and berries, natives of Europe and North America. 2045 Empétrum \(L\).

\section*{Order CXLI. URTICEE.}

Few are the objects in this order deserving the care of the cultivator; it is rather extraordinary, however, that those few are abundantly so. Among worthless weeds and shabby half herbaceous shrubs, some of which are' covered with rough points, and others defended by stinging hairs, we find the fig, the mulberry, the hemp, the hop, and the bread-fruit, all objects of the first consequence to the world. Here also is placed the half fabulous Upas, with which lying travellers and credulous naturalists have long deluded Europe. The Upas tree is now known to be the Antiáris toxicaria, the inspissated juice of which is indeed a frightful poison, but the baneful effects of whose branches are purely imaginary. Similar, though inferior, qualities have been found to exist in Ficus toxicaria, and some of the Artocárpuses. The root of the black mulberry is bitter, acrid, and purgative; of Dorstenia brasiliénsis, emetic; of D. contrayérba, bitter, aromatic, hot, and stimulant. A decoction, or the dried leaves, of hemp, is eminently narcotic, and forms the basis of the well known intoxicating Turkish drug called Bang or Haschisch. The tenacious nature of the fibres of the hemp is also found in other plants of the order, especially Urtica eannabina, the hop, the bread-fruit tree, tho common stinging-nettle, and others.

\section*{Order CXLII. AMENTACEE.}

Here is the group in which all the timber trees of Europe, and most of those of all cold countries, are stationed. Every genus consists of plants important to the wants of man. The alder, the birch, the willow, the poplar, the oak, the chesnut, the hornbeam, and the plane, are all collected in this place, to which they have been brought by the coincidence of similar fructification existing in all of them. This similarity depends upon their producing flowers of one sex only, the males of which are always arrayed in catkins, of which the flowers are destitute of calyx or corolla, in the place of which is produced a single scale. Their bark is furnished with an astringent principle, which has rendered them valuable either for staining black, as in the alder and the oak gall; or for tanning, as in the oak; or as febrifuges, as the alder, the birch, the oak, most of the willows, and also Pópulus tremuloides, which is well known in North America as a tonic and stomachic febrifuge. The substance called tacamahaca was formerly supposed to be produced by some of the poplars, but it is now believed to be obtained from a very different plant, Fagára octándra. The fruit of many A mentáceæ contains a considerable proportion of fæcula, which renders it fit for the food of man and other animals, as the acorns of the oak, the mast of birch, the nut of Castánea and Córylus, \&c.

Order CXLIII. ULMACEE.
Many of the observations upon the last order are also applicable to this, which differs rather in certain technical characters, than in any arrangement of nature. The elm is its representative, from which the others only slightly differ.

615 U'Imus \(L\).
2145 Céltis \(W\).

\section*{ORDER CXLIV. CASUARINEF}

These are nearly related to Coniferæ, than which they are dwarfer, and of far less importance. By various writers they have been tossed about between Amentaceæ and Coniferæ, and have at last settled in a place by themselves. The leaves of Comptónia asplenifólia are employed in the United States against diarrhœa. The berries of Myrica cerifera yield, on boiling, an abundance of wax which is manufactured into candles; the nuts of Ephédra distachya are eatable; the wood of some of the Casuarinas is remarkably hard and durable.

2056 Nagèia Gartn.
2115 Ephédra \(W\).
2055 Myrica \(W\).

\section*{Order CXLV. CONIFERA.}

These bear the same relation in point of consequence to resinous trees, that Amentaceæ bear to those that are not resinous. They are well known as lofty timber, yielding valuable wood and abundance of resin.

Among them is now numbered the loftiest tree in the world, a species of pine found by Mr. Douglas in California, which grows 220 feet high, with a circumference of 60 feet. Pitch, turpentine, Venice turpentine, are produced by various species. Gum Sandarach, by Thía quadrivalvis; a matter like olibanum, by Juniperus lýcia; a sort of liquid storax, by Altingia excelsa. The Juniperuses in which the resin is "incompletely oxygenized," are more fragrant, and also stimulating in a greater degree; as the savin for example. The berries of many of these plants possess similar qualities. Their seeds are all oily; those of Pínus Pínea, Cémbra, and Lambertiána, and Salisburia adiantifólia, are eatable as nuts. The fleshy fruit of the ivy, which is poisonous, is an exception to the general innoxious character of the order. Coniferæ are mostly inhabitants of the northern parts of the world, where they form immense forests, and supply with their dense persistent leaves the place occupied by the evergreen trees of warmer climates. A few are found in the southern hemisphere.

2016 Podocárpus L'her.
2114 Táxus \(W\).

\section*{Order CXLVI, CHLORANTHE}

Obscure Asiatic weeds of no known use, and wholly destitute of interest for gardens.
25 Chloránthus \(W\).

\section*{Order CXLVII. PIPERACEA.}

The peppers are far more valuable in commerce than interesting in cultivation, their flowers being in all cases very insignificant, and their leaves so uniform in appearance, as to create but litfle variety. Nearly the whole indeed of the herbaceous species or Peperómias, as they are sometimes called, are mere weeds. The berry of the pepper is well known to be hot, aromatic, pungent, and stimulating; not only in the common peppers of the shops, but also in \(\mathbf{P}\). cubéba, carpínga, and heterophýllum. The Piper anisfátum yields a strong smell of anise; a decoction of its berries is used in Spanish America for washing ulcers. The Piper Bétel and Siribóa afford the Malays a powerfully acrid and exciting preparation, which, they suppose, invigorates and ena bles them to withstand the debilitating influence of their climate. In the South Sea Islands, an inebriating beverage is procured by the mixture of the leaves and stems of P. inébrians with water. No pepper has yet been found beyond the limits of the tropics. Saururus is the representative of the order in extra-tropical countries.

77 Píper W.
872 Saurúrus \(W\).

\section*{Order CXLVIII. CYCADEÆ.}

The true station of this very curious order is extremely uncertain. Although placed here in conformity with the common practice, it is to be supposed that its true station is in the immediate vicinity of ferns, with which the species agree in vernation, and in many curious particulars. All are natives of countries beyond the reach of frosts, chiefly of the Cape of Good Hope and equinoctial America. With a low trunk which rarely exceeds the height of a few inches, they have the fronds and appearance of pigmy palms, and the inflorescence of gigantic Equisétums. The trunk of Cycas contains a great quantity of fæcula, which is manufactured into a kind of spurious sago; and a similar substance, it has lately been ascertained, may be obtained from the stem of Cycas. (Gard. Mag., vol. iv.)

2107 Cýcas \(W\).
2108 Zámia \(W\).

\section*{Class II. MONOCOTYLEDONES.}

The physiological peculiarities of this class of plants have been already explained in the general remarks which precede this arrangement of natural orders. To what is there stated, little remains to be added, except that in these northern regions, every thing included in it is herbaceous, and that in hotter latitudes, few cleserve the name of either bush or tree, except the palms, and a few Aroideæ and Asphodeleæ.

\section*{SEction I. STAMENS EPIGYNOUS.}

\section*{Order CXLIX. HYDROCHARIDEF.}

Floating white-flowered plants, of which Stratiótes is the most majestic. They possess no known properties, but have the singular character in Monocotyledones of being in some cases lactescent. The species are natives of various parts of the world.
\[

\]

\section*{Order CL. ORCHIDEE.}

Of all tribes of plants, this is the most singular, the most fragrant, and the most difficult of culture. The flowers are often remarkable for their grotesque configuration, which has been likened to heads and bodies of animals, and for the strange character of their stems, which are sometimes attenuated into a degree of gracefulness scarcely equalled even among grasses, and sometimes contracted into a clumsy goutiness of figure such as is known no where else. The species are found inhabiting the mountains and meadows of the cooler parts of the globe, or adhering by their tortuous roots to the branches of the loftiest trees of the tropical forest, to which their blossoms often lend a beauty not their own. Vulgarly, this last description of plants is called parasitic; they are, however, not so, deriving no support from the juices of the plants on which they grow; but on the contrary, are epiphytes, merely adhering to other plants for support, and vegetating amidst the rich black soil which collects at the foot of all trees growing in a hot humid climate. It is very singular that the pollen of these plants has no parallel, except among the very different and distinct order of Asclepiadcæ. The only medical properties of the order exist in the roots of some of the \(O^{\prime}\) rchises, from which the nutritious substance called salop is prepared. The Vanilla of the shops is the pod of the genus called Vanilla. From the boiled stems of some of the Brazilian species a tenacious glue is obtained, which is employed in many useful purposes.

\section*{Order CLI. SCITAMINEe.}

These are distinguished from the last by their pollen not cohering in masses, their seeds not being winged, and their plurilocular ovarium. Their sensible qualities are also widely different. The species are natives only of the tropical parts of the world, where they form stemless or caulescent herbaceous plants, with long broad leaves, and flowers of white, yellow, or red, often possessing great fragrance, and generally much beauty. Their sensible qualities reside either in the root or the seeds. The former is the part used of the Ginger, the Galangale, the Cóstus, Turmeric, Zedoary, and others, all of which are more or less aromatic. The root of turmeric is also well known as affording a yellow dye, a property which it possesses in common with some others. The seeds of Cardamom are well known for their aromatic stimulating powers.

2 \text { Maránta } W . & 5 \text { Phrynium } W .
\end{array}
\]

3 Calathéa Meyer.

\section*{Order CLIII. MUSACEE,}

A noble order of plants, resembling the two last in appearance, but of far more gigantic stature, different geographical distribution, and sensible qualities. All the species, without exception, are among the grandest in the vegetable world, whether the breadth and beauty of their foliage, or the surpassing grandeur of their flowers, be considered. They are not, like Scitamineæ and Cannex, confined to the tropics, but approach in many points towards the cooler latitudes of either hemisphere. While the Strelítzias, resplendent with orange and scarlet and white, are peculiar to the Cape of Good Hope, the plantain is laden with its enormous masses of wholesome pleasant fruit, in the mild climate of Madeira; the Heliconias and Uranias appear in the sultriest forests of Madagascar and Guiana. The fruit of the Músa is, as just stated, pleasant and wholesome; the leaves of the same plant form a valuable thatching for cottages; and the fibres of a particular species are manufactured into a fine hemp, from which the most delicate muslins of India are prepared.

570 Helicónia \(W . \quad 571\) Strelitzia \(H . K . \quad 721\) Músa \(W . \quad 722\) Uránia \(W\).

\section*{Order CLIV. H压MODORACEA}

The name of this order, derived from cifce, blood, indicates its most striking peculiarity ; the roots of several species of Hæmodórum, Wachendorfia, and Heritiéra yielding a brilliant crimson dye. The species have equitant leaves, and six stamens, with anthers turned towards the ovarium ; in which last character they differ from the closely allied order of Irideæ. They are found, with very few exceptions, in the Cape of Good Hope and New Holland
108 Xiphídium \(W\).

718 Lophiola B. M.
720 Anigozánthos Lab.
110 Wachendórfia Ker 113 Dilátris Ker
719 Argolásia Juss.

\section*{Order CLV. IRIDE压.}

The peculiarity of this order exists in the superior six-cleft perianthium, three stamens opposite the outer segments, and the anthers so inserted that the line of their bursting is towards the outaide of their flower. Occasionally, they are still called by the old appellation of Ensatæ. Most of the species are extremely beautiful; and as they are generally very easily cultivated, they have become universal favorites in gardens. Many of the species are found by the side of streams, or in rich pastures in Europe, Siberia, and America; others adorn the most barren deserts of the same countries, with their perishable flowers; a third set, consisting for the most part of Sisyrinchium and its allies, are found in cool parts of the islands in the South Seas; and, lastly, a large proportion of the order contributes to the herbage of Southern Africa, that indescribable charm which has captivated all observers. Their medicinal virtues are trifling. I'ris forentína and germánica have roots, which, when dry, smell like violets, and are slightly stimulant, acting as sternutatories or purgatives, according as they are employed. The etigmas of the Crocus form the well-known saffron, which differs from the general character of the order, in being aromatic, and possessing a valuable coloring matter, which has the singular property of entirely disappearing under the intluence of the sun's rays.

Order CLX．ASPHODELEÆ．
Different from Hemerocallideæ in their expanded flowers and dark crustaceous seed－coat ；the only charac－ ters which have yet been discovered to distinguish them．The species are all pretty，many very handsome， some bulbous，some with fasciculated roots，a few with arborescent stems．They are uncommon in tropical countries，very abundant in temperate latitudes，and not unfrequent in the cooler regions of the world． Among the prettiest are Gágea，Scilla，and Hyacinthus；the least interesting are Chlorophýtum and Zuc－ cágnia．Aspáragus and Drace＇na have berried fruits；the former is diuretic，and when young is employed as a favorite food；the same properties are possessed by Scilla and A＇llium．The stamens of Arthropódium are remarkable for their tuft of yellow hairs，of Dianella for the thickening of the filaments．Many of the A lliums are very pretty，and admired notwithstanding their unpleasant odor；their roots are all eatable，and those of some among the most useful articles of food．Thysanotus，the fringed violet of New Holland，has rich purple blossoms，with long delicate fringes which sparkle in the sun，as if continually bedewed with minute particles of water．From Phórmium ténax the strong fibrous substance called New Zealand flax is prepared．Xan－ thorrhæ＇a has an arborescent stem which abounds in resin．

\section*{Order CLXI．SMiLAcete}

These scarcely differ from the baccate Asphodeleæ，except in their usually trifid style，and the membranous integuments of the sced．Many are interesting plants，especially the lily of the valley，a species of Conval－ lária，the odor of which is perhaps the most grateful in the vegetable kingdom．Several others，as Uvulária， Smilacina，Polygonátum，and Trílium are objects of ornament．Smilax is remarkable for its twining stems， and its leaves，which resemble those of Dicotyledones；the roots of several species form the sarsaparilla of the shops，a drug，the nature of which is mucilaginous and rather bitter，and which is employed as diaphoretic and diuretic．Medéola is also an active diuretic．The roots of Támus are purgative and dangerous．

\section*{Order CLXII．BROMELIACE压．}

Of these the eatable pine－apple is the representative，from which the other genera differ more in the want of a fleshy fruit than in general appearance．Their habit is acid，their leaves rigid and toothed with spines，and covered with minute scales，their bractere often colored with scarlet，and their flowers either white or blue．

They are all natives of tropical countries, with the exception of Tillándsia, which, in the humid woods of Carolina, forms dense festoons among the branches of the trees; this, like many others of the order, is an epiphyte, vegetating among the black mould that collects upon the bark of trees in hot damp countries; others are inhabitants of deep and gloomy forests; and others form, with their spiny leaves, an impenetrable herbage in the extensive pampas of Buenos Ayres and Brazil. From the Agáve mexicana a fermented, beverage is prepared, from which a strong colorless spirit, resembling the best Scotch whiskey, is distilled.

\section*{Order CLXIII. LILIACEE,}

It is doubted whether several of the preceding orders are not rather sections of this; until, however, the combination of these shall be effected by some hand yet more masterly than those by which they have been divided, it is best to let them remain as they are. The beauty of the plants composing the Liliaceæ, strictly so called, is universally acknowledged; the rich colors of the branching lilies, the vivid hues of the painted tulip, the modest graces of the humble Erythroniums, and the portly forms of the Yaccas are all attractions of which no good garden should be destitute. The species are all inhabitants of either cold or temperate latitudes.

772 Tálipa \(W\). & 781 Yaca \(W\).
\end{tabular}

\section*{Order ClXIV. Melanthacee.}

These, too, are pretty herbs, although destitute of the grandeur of the preceding,-which, however, they far surpass in the potency of their virtues. The flowers of many are inconspicuous, and of a dull-green or yellow color, sometimes assuming a livid hue, which will bespeak the nature of their powers. . A dangerous or poisonous acrid juice is their characteristic, which is particularly active in some of them, such as the Colchicum and Verátrum. The roots of the former are the basis of the eau médicinale, and are now used in cases of gout with much success. The root of Veratrism is believed to have been the hellebore of the ancients, an active drug, which, administered in small doses, is a drastic purgative, in more abundance a violent emetic. The root of Helonias dioica, infused in water, is anthelmintic, but, steeped in spirits, yields a bitter and tonic tincture. The leaves of Colchicum and Veratrum often produce vomiting and severe pain in the animals that eat them; the flowers of the first are also said to be poisonous, and its seeds to possess the same properties as the roots, but in a milder degree. Groves and pastures in Europe and Siberia and North America are the most frequented by Melanthaceæ, several are found at the Cape, and Gloriosa is a native of the woods of middle Africa

\section*{Order CLXV. BUTOMEIC.}

Fine water plants, of which Butomus, by general consent the most beautiful of British plants, has purple fowers; and Limnocháris, a native of the marshes of Brazil, has yellow ones.

939 Bútomus \(W\).
1175 Limnocháris Rich.

\section*{Order CLXVI. ALISMACEJ.}

Handsome water plants, with white flowers, and many ovaria. Some are common in our English ditches, others are found in similar situations in the tropics.
\[
860 \text { Actinocárpus } R . B r . \quad 1988 \text { Sagittária } W . \quad 861 \text { Alisma } W \text {. }
\]

\section*{Order CLXVII. COMMELINEA.}

Mostly inhabitants of marshy ground, in either hemisphere, but not known in Europe except in cultivation. America is their grand station. Many are insignificant creeping plants, especially the Commelinas; others, as the Pontederias are very handsome; and the Dichorizándras are exceedingly noble caulescent plants, with large thyrses of blue flowers : this color is the prevailing one of the order.

\section*{Order CLXVIII. JUNCEE.}

Inconspicuous, rigid, worthless weeds, for the most part; Xyris and Philydrum, which have pretty yellow flowers, if belonging to the order, being exceptions. They clothe barren ground in most parts of the world, and are the first approach to the formation of a regular perianthium, as we ascend in the scale of vegetation. Xerótes has the habit of a low palm.
86 Xýris \(L\).
761 Lúzula Dec.
760 Júncus \(L\).
839 Flagellária \(W\).
2076 Xerótes \(R . B r\).

Order CLXIX. ERIOCAULE压
Pretty interesting little bog plants, found in all parts of the world. The order consists of Eriocaulon only, many of whose species are easily cultivated, though seldom seen in gardens. The Eriocaulon septanguláre, found in a lake in the Isle of Skye, is, perhapss the rarest of European plants. They are not known to possess any medical virtues.

223 Eriocaúlon \(\boldsymbol{W}\).

\section*{Order CLXX. PANDANE压.}

With the habit of palms, and the inflorescence of Aroidex, this fine order stands very distinctly separated from all others. The stem is an arborescent caudex, either growing to a considerable height, or weak, and lying on the ground. The leaves of some are formed into a coarse cordage ; the flowers of P. odoratissimus, and the fruit of some others, are eaten. All axe tropical.

2004 Carludóvica Fl. per.
2041 Pandánus \(W\).

\section*{Order CLXXI. NAIADES.}

Floating uninteresting plants, scarcely susceptible of cultivation : they form a close approach to Cellulares. 1938 Zannichéllia \(W\).

\section*{Order CI,XXII. RESTIACET.}

Rigid, inelegant, often leafless plants, with split vaginæ, and the habit of some Cyperaceæ, or true Junceæ. They are all inhabitants of the southern hemisphere, especially of the Cape of Good Hope and New Hollard. 2046 Willdenóvia Th.

2047 Réstio \(W\).
2048 Elégia \(W\).
2110 Leptocárpus R. Br.

\section*{Order CLXXIII. PALME}

These were well named by Linnæus, the princes of the vegetable world; for they far surpass all other plants in the grandeur and majesty of their port. Their lofty stem, supported by a mass of fibrous roots, which frequently creep along the surface of the ground, consists of wood with longitudinal fibres, soft in the centre, but hard as horn itself at the circumference; it is almost always unbranched, bearing a tuft of leaves at the summit; in a very few cases it is dichotomous, always round, and it terminates by a single bud; by the fall of the petioles of the leaves, which sheath it in a greater or less degree at the base, it is covered with large scars, The leaves, technically called fronds, are pinnate or flabelliform, never simple; and, in a young state, before they expand, they are folded up in plaits from the base to the apex. The flowers are small, with bracteæ at their base, either sessile or seated in some cavity, of a pallid color, and contained in a large bag called a spatha; when they open, the mass of inflorescence, called a spadix, bursts suddenly through the under side of the spatha, generally evolving the most fragrant odors. Impregnation takes place rapidly, through the injection of the pollen upon the humid surface of the stigmas, which gape open to receive it. The fruit is perfected in a period varying from six months to a year; when ripe it is a drupe or berry, with either a fibrous or fleshy coat ; the mass of its kernel consists of oily albumen, which, in the case of the cocoa nut, is soft enough to be eaten, but which in most species is as hard as horn. Dr. von Martius, the celebrated traveller in Brazil, to whom the world is indebted for nearly all that is known of these plants, concludes his remarks upon the characters of the order in the following words: - "Palms, the noble offspring of Terra and Phcebus, are natives of those happy countries within the tropics, where the rays of the latter are ever beaming. In all such climates they are to be found, with this limitation, however, that in the southern hemisphere they do not overstep the 35 th degree of latitude, nor in the northern the 40th. Most species are confined within fixed and narrow bounds, for it comes to pass that wherever a district is characterized by striking peculiarities of soil or climate, those species exist which are not found elsewhere; but few, on the contrary, extend over a large extent of surface, as the Cócos nucifera, Acrocómia sclerocárpa, Borássus flabellifórmis, \&c. It is probable that the number of palms existing on the face of the earth, wili be found by future travellers to amount to as many as a thousand species. Most of them love the margins of springs and streams, but few establish themselves on the shores of the ocean, and yet a smaller number ascend into the alpine regions of their country; some collect in large forests; some are scattered singly or in clusters, among woods and plains. In the most ancient periods of the world, when the genera of plants were beginning to be formed, palms scarcely existed; they were preceded in the creation by the more ancient Ferns, Cycadeæ, Grasses, and Equisetaceæ. Some of their remains have, however, been found in variegated sandstone, and in limestone of the third order (fletzkalk), part of which belong to unknown species, and part to species still in existence. But in the times succeeding the deluge, they appear, from the written evidence of historians and poets, to have followed the footsteps of man, to whom their fruit yiclded food, drink, and oil; their stems houses, arms, utensils, flour, and wine; and their leaves cordage and roofs for habitations. In cultivation their soil should be slightly saline; thev are propagated by seeds more readily than by truncheons of the stem; when cultivated they undergo no alteration, except in producing more fleshy or stemless fruit: it is extremely difficult to transplant them beyond their own country; naturally their migration is absolutely opposed by the barriers of the ocean."

\section*{Section III. STAMENS HYPOGYNOUS.}

\section*{Order CLXXIV. GRAMINEE.}

The order of grasses is beyond doubt the most natural of all that the ingenuity of systematic botanists has contrived; it is also the most numerous in species. The inflorescence is very much alike throughout the order, and the floral envelopes, which are bracteæ in a progressive state to the form of calyx and petals, offer few striking characters by which the genera can be characterized. Hience it is that the classification of the order, and its division into genera, has not only been found extremely difficult, but has given rise to much difference of opinion among botanists; some of whom, adhering to the synthetical arrangement of Linnæus, admit but a small number of genera, while others, admitting the analytical principles of modern science, divide it into a vast number. The middle course in this, as in most other cases, is probably the just one. A subdivision of the order into tribes, has been attempted by Palisot, Trinius, Dumortier, Raspail, Kunth, Iank, and others ; that of M. Kunth is here adopted. The general habit of grasses is so familiar to every one, that it may be passed over in silence. They are remarkable for exhibiting, in no case, properties that are actually poisonous; possessing on the contrary, in almost all cases, wholesome and nutritive qualities. These latter are especially obvious in their seeds, which always contain a farinaceous substance, mixed with a certain proportion of glutinous matter. No one is ignorant of the various and important uses of the seeds of wheat, rye, barley, oats, maize, rice, and others, and in general of all the larger kinds of grass. It must however be remarked, that if the smaller sorts are not employed in like manner, it is merely on account of their minuteness, and not on account of any difference in their nature; in fact, in times of scarcity, and in half cultivated countries, use has advantageously been made of Festuca fluitans, Zizánia aquática, Avéna fátua, Pánicum sanguinále, Avéna elátior, Brómus secalinus, and E'lymus arenárius. It is also to be noted, that the particular uses for which the seeds of certain grasses are employed, are not peculiar to them, but may be obtained from all the others, with slight modifications. Thus beer is made, not only from barley but also from wheat; spirituous liquors not only from our European cerealia, but also from rice. But it must he remarked, that a singular exception to the generally wholesome properties of grasses, appears to exist in Lólium temuléntum, the seed of which is reported to be narcotic and inebriating, and even poisonous; there is no doubt, however, that these qualities have been greatly exaggerated; for in the first place they disappear in bread or beer manufactured from Lólium temuléntum; and secondly, in times of scarcity, people have frequently lived upon it. But even supposing all that has been stated upon the subject to be true, this plant will still be found to be little different from wheat, when long exposed to wet ; so well, indeed, is this known by country people, that a belief exists, that in wet summers wheat is actually transmuted into rye grass. The exciting properties of the oat, which are very unusual in this order, have been found to reside in the husk and not in the seed, and to depend upon the presence of a minute quantity of an aromatic principle, analogous to Vanilla, lying imbedded in the envelope of the seed, and capable of being extracted by aid of alcohol. As to the deleterious effects of the ergot of rye, these do not depend certainly upon any such property in the rye itself, but is caused either by the ergot disease, or, as is believed, by the parasitic fungus, from the attack of which it arises. Now let us pass from the seeds of Gramineæ to their stems, and we shall find a no less remarkable uniformity of nature in them. They all rontain, especially before flowering, a sweet sugary mucilage, which varies in quantity in different species. The sugar cane, in which this is found in greatest abundance, not only constantly exists in the most favorable condition for producing it, as it rarely fowers, but is also one of the largest grasses known. The maize also abounds in sugar; and the same substance is secreted in such abundance by the Sórghum saccharátum, that attempts have actually been made in Italy to cultivate it as the sugar cane. The creeping routs of grasses, which are generally mucilaginous and demulcent, are sometimes used in medicine; but they are of more importance for retaining in banks the sand of the sea shore, so as to form artificial cliffs on flat coasts, to restrain the inroads of the sea. The stems of Andropogon schænánthus, the leaves of Andropógon citrátum, the roots of Andropógon nárdus, and the whole plant of all the species of Anthoxánthum, exhale an aromatic odor, and possess slightly tonic properties. To conclude, the epidermis of grasses has been found to contain a considerable quantity of silex.

\section*{Order CLXXV．CYPERACE压．}

The sedges，as these may be ca led in English，differ from grasses not only in their comparative worthless－ ness，and the different developement of the parts of fructification，but also in the sheath，at the base of the leaves，being closed up，not slit．As objects of ornament they are of no value，and as subjects of agricultural interest of but little ；they are，moreover，of＇ittle utility to man．They are chiefly valuable for covering，with the appearance of herbage，waste，and barren，marshy，or sandy tracts，in which little else will thrive．The roots of Cárex arenária，disticha，and hírta，possess diaphoretic and demulcent properties，whence they are sometimes called German sarsaparilla．Some of the Scirpuses and Cypéruses have eatable nutty roots；the stems of Scírpus lacústris，Eleócharis palústris，Cypérus téxtilis，and others，are manufactured into mats and the bottoms of chairs；the roots of Cypérus esculentus abound in oil，a very unusual circumstance；the papyrus of the ancients was manufactured from the stem of Cypérus papyrus；finally，the roots of Cyperu＇ Jóngus，odorátus，and others，are fragrant．

\section*{Order CLXXVI．AROTDE压．}

Herbaceous，stemless，or caulescent plants，with broad fleshy leaves，approaching very nearly to those of Dicotyledons．Their flowers are enclosed within a spatha，and are imbedded on a simple cylindrical spadix． Some are natives of Europe and of similar latitudes，but the greater number inhabit the tropics，where they often climb by their rooting stems to the tops of lofty trees．They have thick fleshy roots，which，when fresh， contain an acrid stimulating principle，which is so volatile that it passes off freely upon the application of heat；whence the roasted roots of many species are among the most common articles of negro food．The leaves of A＇rum seguinum are so paralyzing，that if chewed they deprive one of the power of utterance； whence in the West Indies it is called the dumb cane；the leaves of Dracontium pertusum are acrid；fresh gathered，and applied all over the surface of the body，they produce a slight inflamination and blistering，and are used in Demerara，by the natives，in dropsical cases．The root of \(A^{\prime}\) rum triphyllum，boiler in milk，has been found efficacious in consumption．The flowers of many species are highly fetid，Typhineæ，or bull－ rushes are very like Cyperaceæ in habit．Pistiacee are floating plants，in which the organs of fructification are reduced to the very simplest state．Juncagineæ are obscure marsh or river plants．

DER CLXXVII. FLUVIALES.
With these the Vasculares and Monocotyledones terminate: it has long been apparent that we have been descending in the scale of vegetation; and hence, the last order exhibited a structure the most simple of all vascular plants. In the present order, Zostéra and Rúppia are so closely allied to Algæ, that they may be mistaken for them.

24 Zostéra \(L\).
318 Rúppią W.

\section*{II. CELLULARES.}

The characteristics of this division have already been explained in the preliminary observations upon the natural orders; and the remarks which were required for each natural order of Cellulares have already been given in Cryptogamia in the body of the work. It has, therefore, been thought advisable to adopt from Profecsor Agardh such observations as he has made upon the orders, as a sort of contrast to those already given.

\section*{Class 1. FOLIACE \(\mathcal{E}\).}

\section*{Order I. FiLices.}

Of these the stem is perennial, often subterraneous and creeping, and occasionally becoming arborescent and leafy above the ground. The fronds or leaves are usually pinnatifid, and more or less compound; sometimes nearly simple and entire, with reticulated veins. The capsules are minute, one-celled, seldom manycelled, brown, membranous, and surrounded by a thick articulated elastic ring, irregularly bursting, and either clustered on the lower surface of the frond, or compound in spikes. Their vernation is circinate, and some are propagated by bulbs. The old botanists denied any fruit whatever to Ferns; believing the seeds of these plants to be so rare as to invest any body with invisibility who could collect them. Afterwards, their capsules were believed to be their seeds. Linnæus, and some others, doubted whether their fructification were seeds or pollen. Finally, the experiments of Ehrhart and Lindsay proved, beyond all cavil, that they were really seeds. As to the male organs nothing is known; some suppose them to be glands of the frond, others the elastic ring, some the indusium, and others the pores of the epidermis; lastly, Martius has supposed them to be the membrane including the spiral vessels. Ferns are chiefly inhabitants of the torrid zone, becoming rarer as we approach the poles. They delight in a humid soil, and they often grow parasitically upon trees. The medicinal virtues of some are highly astringent, of others anthelmintic, of others purgative; some have acquired celebrity for their pectoral, others for their corroborant qualities. The young leaves and roots of some constitute an article of food; beer is obtained from the roots of others, and, finally, Aspidium fragrans has been used as tea.

\section*{Order II. EQUISETACE厌,}

Marsh plants, with a verticillate arrangement of their branches, and a highly indurated epidermis, Their seeds are remarkable for a hygrometrical movement. The quality of some is said to be hurtful to cattle, which is denied by others. Formerly they were used in medicine as astringents and diuretics. Equisétum hyemále has been employed for tea, and as a polishing material for furniture, under the name of Dutch rushes.

\section*{2211 Equisétum L.}

\section*{Order III. LYCOPODINE压}

With the habits of mosses they have the seeds of ferns. They are herbaceous prostrate plants, with imbricated simple leaves. Lycopódium complanátum, Selago, and clavátum as used as dyes; the sporules of Lycopódium clavatum are said to be employed for ameliorating wine, and are also used in making fire-works, on account of their inflammable nature. The herb of Lycopodium clavátum and Selágo is emetic, and produces abortion. Lycopódium phlegmária is reputed an aphrodisiac.

2212 Lycopódium 1 .
2213 Psilútum Suz.
Order IV. MARSILEACE \(\mathrm{E}^{2}\)
Floating or erect simple-leaved plants of no known use. The Marsileas, which are to some countries what Lémna is to this, are not known in cultivation.

\section*{Class II. APHYLLE}

\section*{Order V. MUSCI.}

Winter plants, reviving in humid air, abundant about the poles, rare at the equator. They cover the mountains of the earth as high as the limits of perpetual snow ; growing in patches, they clothe the most barren spots with verdure, preserve trees from heat and cold, prepare the earth for nourishing more perfect plants, and fill up bogs and morasses with vegetable matter. To the economy of nature they are, therefore, more subservient than to the purposes of man. Medicinal astringent properties were formerly ascribed to some few, but they are now neglected or forgotten.

2255 Riccia E. B.
2256 Anthóceros E. B.

2257 Targiónia E. B.
2258 Sphærocárpus E. B.

Order VII. ALG压.
Plants ascending from the simplest form known in vegetation to a very compound state. The Iowest are filiform, leafless, with their fructification immersed; the highest are leafy, with the fructification included in an indehiscent wart-like pericarpium. Some copulate like animals, others have a spontaneous motion like worms. Their color is lively, in the lowest grades green, in the highest red or purple. Some are ephemaral and microscopical, annual or perennial, and others extend to the length of many fathoms. They grow at the bottom of the sea, or in fresh water, the depths of which they clothe with vegetation, as the higher orders of plants cover the earth with forests. They grow on stems in the water only, or on each other. Some exhale oxygen, others are scented like violets. Their tasse is mild; their substance gelatinous, membranous, or coriaceous, usually covered externally with mucus. The structure of the lowest is articulated; of the highest fibrous.

Order VIII. LICHENS.
Lichens are not only most useful in the Economy of Nature, as preparing the surface of the earth for the reception of larger vegetables, but they are, moreover, of great utility to man. Many, as Cetrária islándica, are eatable, having a bitter principle, and giving out a styptic tincture, if immersed in alcohol. Others, steeped in urine or salts, are used for dying ; crustaceous species of this kind are Variolária oreina, Lecanóra tartárea, Leprária chlorina, \&c. ; foliaceous species, Parmélia saxátilis, Stícta pulmonácea, Solorína crócea, Gyróphora defista and pustuláta, \&c. ; and branched kinds, Roccélla tinctória (the common Orchal), U'snea plicáta, Alectória jubáta, and others. In medicine, Cetrária islándica and nivális, Stícta pulmonácea, Alectória usneoídes are tonic and nutritive; Parmélia parietína, Borréra purpurácea, Evérnia prunástri, \&rc., are astringent and febrifugal ; Peltidéa aphthósa, anthelmintic; Evérnia vulpína, poisonous. Some yield a gum, as Evérnia prunástri; Sticta pulmonácea may be employed for bittering beer instead of hops, and Ramalina
scopulbrum instead of scap. The various species give the grey hue to old walls and stones, cover desert heaths and mottle the bark of ancient trees.

\section*{Order IX. FUNGI.}

We have now reached the lowest station of vegetable existence, in arriving where the vesicles which compose the vegetable fabric are combined in various forms, according to the contingent circumstances under which they are developed. The mould on the cheese, the ergot of corn, the rust of the rose, and the huge Bolétus, which, in Java, spreads out its many-handed body from the trunks of ancient trees like a vegetating demon, differ only in the number of the vesicles of which they are composed. Many species are eatable, as Agáricus campéstris; others are deadly, as Bolétus scáber; some are used medicinally, as Dædálea suavéolens in coughs; Agáricus túba regínæ in diarrhœa; Agáricus piperátus in calculous disorders; Phállus Mokúsin against cancer; Polypórus annósus against the bites of serpents. Some Copríni are used for healing ulcers; Polypórus officinális as a purgative; Polypórus igniárius as a styptic; Polypórus destrúctor, and a number of others, constitute dry rot. For the poison of fungi, the roots of garlic, the leaves of parsley, and tincture of lacmus, are said to be remedies: so also is common spirit. Fungi swarm in all the coldest countries of the world, but as we approach the equator they are extremely rare; the place where they most flourish is Sweden, and the adjacent regions.

After the most perfect classification which the present state of botanical knowledge renders practicable, there still remain a few genera which are incapable of having their true station assigned to them, either in consequence of their structure being incomy 'etely known, or of their affinity not having yet been discovered. As far as this work is concerned, they are the following, all of which are Dicotyledones.

1966 A úcuba \(W\).
405 Bréxia Nor.
442 Vallésia Fl. per.
1462 Aitónia \(W\).
2068 Antidésma \(W\). 2163 Laurophýllus \(W\).
2098 Eáclea \(W\). 1986 Ceratophÿllum \(W\).

\title{
GLOSSARY
}

OF

\section*{TERMS USED IN THE GENERIC AND SPECIFIC DESCRIPTIONS, IN THE GENERAL observations on the classes, and in the notes.}

The figures between parentheses ( ) refer to the engravings at the bottom of the page.
After each term a reference is given to an example of its application in the body of the work: in these references, g. signifies genus, s. species, p. page.

\section*{A.}

A, in composition, signifies without, as Aphyllus, without leaves; Acaulis, without stem. s. 1339. Abbreviate (abbreviare, to shorten). Used in comparative descriptions, to indicate that one part is shorter than another. Sálvia crassifólia, s. 420.
Aberrant, deviating from the natural or direct way; applied in Natural History to species or genera that deviate from the usual characters of their neighbours. p. 408.
Abortion (1) signifies an imperfect developement of any given organ. Cephalánthus, g. 275. p. 78.
Abraded, rubbed or worn off. Acácia, g. 2127. (note.)
Abstergent, cleansing, having a cleansing quality. Sapindus, g. 926. (note.)
Accessory, something added to the usual number of organs, or their parts. Phálaris, g. 168. p. 32.
Accretion, the growing of one thing to another. p. 748.
Accumbent, lying on, prostrate, supine; this term is employed in Cruciferæ, to signify a radicle, which lies upon the edge of the Cotyledons. p. 536.
Acerose, (2) needle-pointed; fine and slender, with a sharp point. Bánksia pulchêlla, s. 1449.
Acescent, sour, tart, acid. Pinguicula, g. 52. (note.)
Acetarious, any thing belonging to the salad tribes of vegetables. Lactúca, g. 1628. (note.)
Acetous, something that produces acidity. Triticum, g. 206, (note.)

Acicular, (3) needle-shaped. Leptospérmum triloculáre, s. 6:+31.
Acinaciform, (4) scimitar-shaped. Ehrhárta, g. 754. p. 238.

Acini, the small stones in grapes, strawberries, \&c. Cecrópia, g. 2043. (note.)
Aculeate, (5) being furrished with aculei or prickles, as distinguished from spines. Spartína polystáchya, s. 920 .

Aculei, prickles, sharp hard processes of the epidermis falling off when old; by which character they are distinguished from spines, which do not fall off. Medicágo marex, s. 10910.
Acuminate, (6) taper-pointed. Cánna indica, s. 2.
Acutangular, (7) having sharp angles. Corchorus acutángulus, s. 7722.
Adnate, (8) adhering to a thing. Anthers are called adnate when they are attached to the filament by their whole length. Anthoxánthum amárum, s. 498.

Adult, the full-grown of any thing : full-grown leaves are aduit leaves. Prótea obtísa, s. 1318.
Eruginous, having a color like that of ærugo or verdigris. Curcúma æruginósa, s. 82.
Agglomerated, collected in a heap or head. Acídium Jacobæ'a, s. 16669.
Aggregate, (9) gathered together; usually applied to a dense sort of inflorescence. Calyménia aggregáta, s. 570 .

Agrumi, a name given by the Italians to any kind of lemons or oranges. Cítrus, g. 1615. (note.)
Alienium, (10) a hard pericarpium, containing a single
sced, which does not adbere to it ; it is the same as the Linnæan nux. Hippophæ'a, g. 2058. p. 817.
Albumen, the substance under the inner coat of the testa, surrounding the embryo; it is sometimes absent. Réseda, g. 1102 . (note.)
Alembick, a vessel used in distilling, or acting like a still. Phœ'nix, g. 2049. (note.)
Alexipharmic, that which counteracts poisons, antidotal. Maránta, g. 2. (note.)
Alexiteric, having the power of doing away poisons. p. 1065.

Alkalescent, having the properties or effects of alkali. R(imex aretósa, g. 856 . (note.)
Alkali, any substance which, when mingled with acid, produces fermentation. Viola, g. 540. (note.)
Alveolate, (11) resembling a honeycomb. Borkhausia, g. 1637. p. 661.

Alvine, of or belonging to the intestines. Acácia, g. 2127. (note.)

Amentum, (12) a catkin; mode of inflorescence. Aponogéton, g. 854. p. 240.
Amplexicaul, (13) stem-clasping ; the base of the leat surrounding the stem. Céstrum auriculátum, s. 2465.

Amylaceous, having the properties of starch. p. 1065. Anastomosing, (14) uniting, or inosculation, of vessels. Cinclidótus, g. 2227. p. 896.
Androgynous, producing both male and female sexes on the same root, or in the same flower. Uncinia, g. 1949. p. 768.

Anfractuose, full of turnings and winding passages. Ochróma, g. 1458. p 560.
Angular, (15) composed of, or furnished with, angles. Lopézia coronáta, s. 103.
Angulo-dentate, (16) angularly tonthed, or angular and toothed Lapsána commúnis, s. 11324.
Annulations, (17) rings or circles. Rivulária, g. 2270. p. 925.

Anterior, growing in front of some other thing. Hákea acanthophylla, s. 1434.
Anthelmintic, capable of killing worms. Geoffróya, g. 1517. (note.)

Antheriferous, (18) bearing anthers. Lopézia, g. 18. p. 1.
Antiaphrodisiacal, any thing which checks the desire of sexual intercourse. Vítex, g. 1317. (note.)
Anti-pestilential, efficacious aganst pestilence. Angélica, g. 664. (note.)
Antiphrasis, the use of words in a sense opposite to that of some neighbouring parallel sentence. Globulária, g. 260. (note.)
Anti-scrophulous, antiscorbutic; efficacious against scurvy. Cynoglóssum, g. 336. (note.)
Antiseptic, efficacious against putrefaction. Artemisia, g. 1721. (note.)

Aperient, having a slight purgative quality. Curcúma, g. 14. (note.)
Apetalous, being without petals. p. 1.
Apex, (19) the summit ; generally applied to any thing terminating in a point. Thália dealbáta, s. 26.
Aphrodisiacal, any thing which excites a desire for sexual intercourse. Justícia, g. 47. (note.)

Aphthous, resembling something covered with little ulcers. Acácia, g. 2127. (note.)
Apiculate, (20) terminating in an apiculus or little point. Rósa microphýlla, s. 7512.
Apiculus, (21) a small point. This term is generally used when the midrib projects beyond the leaf, forming a little point, or when a small point is very suddenly and abruptly formed. Tórtula unguiculáta, s. 14757.

Apophysis, (22) a swelling beneath the theca of a moss. Spláchnum, g. 2231. p. 896.
Appendix, (23) that which is attached. Sarracenia rúbra, s. 7675.
Appense, being hung up as a hat is upon a pin; an approach to pendulous. Pimenta, g. 1123. p. 409.
Appressed, placed close upon something else; when
hairs lie flat upon the surface of a plant, they are said to be qppressed. Stachytárpheta hirsutíssima, s. 337.

Approximated, near together. Sálvia truncáta, 8. 445. Apterous, without wings, or the membranous margins which botanists call wings. Pinguicula, g.52. (note.)
Aquatics, growing in or belonging to water. p. 1.
Arboreous, being a tree, as distinguished from frutescent or shrubby. Pelargónium discipes, s. 9633.
Arborescent, having a tendency to become a tree. Píper tomentósum, s. 517 .
Arcuate, curved or bent like a bow. Hypécoum procúmbens, s. 1815.
Areola, (24) little spaces or areas on the surface of a thing: the surface of crustaceous lichens is often cracked in every direction; the spaces between the cracks are the areolæ. Lecidéa coracina, s. 15378.
Areolated, the adjective of the last term, Solenia, g. 2307. p. 925.

Aridity, dryness. Xerótes, g. 2076. (note.)
Arillate, having that peculiar appendage called the Arillus. The term is only applied to seeds. p. 751.
Arillus, (25) a process of the placenta adhering to the hilum of seeds, and sometimes enveloping them. Phrýntum, g. 5. p. 1.
Aristate, bearded, as the glumes of barley. Many grasses.
Aroma, the spicy quality of a thing. Justicia, g. 47. (note.)
Articulation, the place where one thing is joined with another, another word for joint. Corynéphorus, g. 169. (note.)

Asci, (26) small tubes in which the sporules of Cryptogamic plants are placed. p. 978.
Ascigerous, having asci. p. 982.
Assurgent, rising upward. Phlox amœ'na, s. 2113.
Attenuate, made thin or slender. Lopézia racemósa, s. 102.

Auriculated, (27) having an ear-like base. Jasminum auriculátum, s. 174 .
Awns, the beard or arista of corn. Salsóla muricáta, S. 3404.

Axil-flowering, flowering in the axilla, Chionánthus axilláris, s. 154
Axilla, literally the armpit; in plants applied to the angle formed by the union of the leaf and stem. Dipsácus, g. 262. (note.)
Axillary, (28) placed in the axilla. Pollichia campéstris, s. 113.
Axis, the line, real or imaginary, that passes through any thing. Actinocárpus, g. 860. (note.)

\section*{B.}

Baccate, berried, having a fleshy coat or covering. Gmélina, g. 1311. p. 493.
Bagged, resembling a bag or sack. Ceanóthus, g. 510. p. 113.

Ball, (29) the round central part of the flower of the Stapélia. p. 199
Bands, (30) or vitta, are the spaces between the elevated lines or ribs of the fruit of umbelliferous plants. Búbon, g. 640. p. 116.
Barred, crossed by a paler color in spaces resembling bars. Sanseviéra glauca, s. 4540.
\begin{tabular}{llll}
20 & 21 & 22 & 23
\end{tabular}

30

31

Beak, any thing which resembles the beak of a bird; hard short points. Bríza, g. 195, p. 33.
Bearded, having long hair like a beard. Wulfénia, g. 50 . p. 9.

Beardletted, having small awns. Cínna arundinácea, s. 1010.

Bicuspidate, (31) twice pointed. Cárex lagopodioídes, s. 13081.

Bidentate, (32) double-toothed, or having two teeth Alantódia axilláris, s. 14527.
Biennial, a plant is said to be biennial which requires two seasons to mature its fruit, and then dies. Philydrum, g. 17. (note.)
Bifarious, (33) placed in two rows. Alpinia tubulảta, s. 50 .

Bifid, (34) half divided in two; two cleft. Cánna lútea, s. 4.

Biglandular, double-glanded. Malpíghia glandulósa, s. 6374.

Bilabiate, (35) having two lips. Diclíptera, g. 48. p. 9. Bilobed, (36) divided into two lobes. O'xalis filicadis, S. 6518.

Binate, growing two together. Córnus suécica, s. 1791.
Bipartible, capable of being parted in two. Prótea, g. 231. p. 77.

Bipinnate, (37) a mode of foliation; twice pinnate. Petróphila pulchélla, s. 1306.
Bipinnatifid, (38) twice pinnatifid, a mode of foliation. Verónica Jacquíni, s. 238.
Bisaccute, having two little sacks, bags, or pouches. Mathiola, g. 1381. p. 536.
Biscutate, (39) resembling two bucklers (scuta) placed side by side. Biscutélla, g. 1413. p. 537.
Biternate, (40) divided in three twice over. Chærophýllum Claytóni, s. 3491.
Bi-tri-crenate, crenate twice or thrice. Jungermánnia pusilla, s. 14958.
Bi-tri-pinnatifid, pinnatifid twice or thrice over. Petróphila diversifólia, s. 1307.
Bi-tri-ternate, growing in threes twice or thrice over. Actæ'a americána, s. 7650.
Bivalved, two-valved, p. 877.
Blanching, made white by being grown in a dark place. Lactúca, g. I628. (note.)
Bland, fair, beautiful. Mesembryanthemum blándum, s. 7348.

Blight, a vague term, signifying a pestilence among plants caused by the attack of insects or of parasitical fungi, or by some endemical affection of the atmosphere. Húmulus, g. 2074. (note.)
Blistered, having the surface raised as the skin is when blistered. Sálvia micrántha, s. 393.
Bole, trunk of a tree. O'rnus, g. 69. (note.)
Boragincous, of or belonging to the natural order Boragineæ. Rhéxia, s. 900. (note.)
Brachiate, (41) having arms or branches usually placed opposite to each other, nearly at right angles with the main stem, and crossing each other alternately. Phillyréa angustifólia, s. 143.
Bracteate, furnished with bracteæ. p. 443.
Bracteola, little bracteæ. Geropógon, g. 1620. p. 661.

By actea, (42) small leaves placed near the calyx. Maránta oblíqua, s, 19.
Branchlets, small branches. Agróstis vulgáris, s. 993.
Bristles, rigid hairs. Ghínia, g. 65, p. 10 .
Bulbiferous, bulb-bearing. Glóbba marantína, s. 96. Bullous, having bulbs. Cypérus, g. 127. p. 31.
Bulbs, (43) underground buds resembling roots, and consisting of numerous fleshy scales placed one over the other. A'llium, g. 796. p. 272.
Burry, covered with hooked stiff hairs, like the heads of Bur or Burdock. Pisónia, g. 864. (note.)
Byssoid, having the appearance of Byssi. p. 979

\section*{C.}

Caducous, falling off soon. Epimédium, g. 297. p.79. Cesious, grey. Curcóma cæ'sia, s. 84.
Caspilose, growing in little tufts. Erínus alpinus, s. 8825.

Calcarate, (44) spurred, or spur-shaped. Alpínia cardamómurn, s. 48.
Calcareous, chalky, or growing on chalk. O'lea, g. 32. (note.)

Calceiform, (45) formed like a little shoe. Pedilánthus, g. 1104. p. 393.

Calli, small callosities, or rough protuberances. Sálvia amarissima, s. 397.
Callous, hardened. Bránia ericoides, s. 3005.
Calycine, of or belonging to a calyx. Cartonéma, g. 90. p. 30.

Calyculated, (46) having bracteolæ resembling an ex ternal or additional calyx. Myóseris, g. 1610. p 661.
Calyptra, (47) literally an extinguisher; applied to the body which tips the theca of a moss, and the like. p. 895.

Calyptrate, having a covering resembling an extinguisher. Eríca coarctáta, s. 5330.
Calyptrate, having a calyptra. Actinophýllum, g. 697. p. 117.

Calyptriformis, shaped like a calyptra. Marcgraávia, g. 1163. p. 456.

Campanulate, (48) bell-shaped. Cóstus, g. 11. p. 1.
Canaliculate, channelled or furrowed. Weíssia acúta, s. 14714.

Cancellate, latticed; resembling lattice-work. Trigonélla cancelláta, s. 10882.
Canescent, hoary, approaching to white. Selágo canéscens, s, 8662.
Capillary, (49) very slender; resembling a hair. Trichóphorum, g. 126. p. 31.
Capitate, (50) growing in a head. Chloränthus, g. 25. p. 1.

Capitular, growing in small heads. Brýum, g. 2240. (note.)
Capituli, small heads. Réseda, g. 1102. (note.)
Capituliform, formed like a small head. Cenomýce, g. 2349. p. 949.

Carbonised, burned to a coal. Quércus súber, g. 2000. (note.)
Carina, (51) a keel like that of a boat; also the two lower petals of papilionaceous flowers. Pongámia, g. 1514. p. 598.

Carinate, keel-shaped. Utriculária mínor, s. 329.
Cariopsis, (52) a one-celled, small, indehiscent pericarpium adhering to the seed which it contains, as the grain of grasses. Hydrastis, g. 1241. p. 459.
Carious, decayed. Juniperus, g. 2113. (note.)
Carminative, medicines which promote perspiration. Pimpinélla ánisum, s. 3562
Carnose, fleshy. Gymnóstomum Griffithsiánum, s. 14671.

Carpella, (53) the small parts out of which compound fruit are formed. Actinocarpus, g. 860. (note.)
Carpology, the science which treats of the structure of fruits and seeds. p. 1056.
Cartilage, gristle. Róchea odoratíssima, s. 3868.
Cartilaginous, gristly. Aspicárpa, g. 29. p. 1.
Cataplasm, a plaster, or more properly a poultice. Zingiber, g. 10 . (note.)
Catarrhal, of or belonging to a cold. Acácia, g \(\Sigma 127\). (note.)
Cathartic, purgative. Gratiola, g. 43. (note.)
Catkin, (12) inflorescence of the natural order Amen. táceæ. Artocárpus, g. 1935. p. 768.
Caudate, tailed, being like a tail. Strophánthus, g. 416. p. 111.

Caudex, the trunk or stem. Cócos aculeáta, s. 13321.
Crudicula, (54) a small membranous process on which the pollen of orchideous plants is fixed. Rodriguézia, g. 1883. p. 749.
Caulescent, acquiring a stem. Trichónema cauléscens, s. 642.

Couline, produced on the stem. Centránthus calcitrápa, s. 112.
Causicity, having a burning quality. Plumbágo, g. 324. (note.)

Caufery, that which burns. Artemisia, g. 1721. (note.) Cellular, composed of cells. Eriocaúlon septanguláre, S. 1295.

Centimetre (55) is a French measure equal to 4 lines \(\frac{432}{1000}\) or near \(4 \frac{1}{2}\) lines. Palmélla, g. 2265 (note.)
Nas lamy

Centuria, hundreds. Buxbaúmia, g. 2236. (note.)
Cephatic, medicinal to the head. Kæmpferia, g. 12 (note.)
Ceraceous, wax-like. Peziza exúmpens, s. \(16 \% 73\).
Cernuous, (56) nodding, drooping, or pendulous. Cánna iridifóra, s. 17.
chaffy, (57) bearing processes resembling chaff. Erio phorum, g. 125. p. 31.
Chalaza, (58) a spot on the seed, indicating where the vessels of the raphe terminate. Eriobótrya, g. 1137. p. 409.

Channel-leaved, (59) folded together so as to resemble a channel for conducting water. Trichonéma bul. bocódium, s, 640 .
Charlatanry, quackery. Mandragóra, g. 447. (note.)
Charring, blackening by fire. Quércus, g. 2000. (note.)
Chlorosis, the green sickness, a disease so called. A'nthemis, g. 1778. (note.)
Cilice, (60) hairs like those of the eyelash, Plantago subuláta, s. 1707.
Ciliary processes, like eyelash hairs. p. 907.
Ciliated, eyelash-haired. Lopézia cordáta, s. 104.
Ciliato-dentate, toothed and fringed with hairs like eyelashes. Cnícus heterophy̆llus, s. 11405.
Cinereous, ash-colored, grey. Grevillea cinérea, s. 1417.

Cingalese, inhabitants of, or belonging to, Ceylon. Mlumbágo zeylánica, s. 1861.
Circinately, (61) curled round like a sharp crook. p. 539. Cirrhiferous, bearing tendrils. Gloriósa supérba, s. 4574.

Cirrhose, or Cirrhous, (62) tendrilled. Bignónia qnguis, s. 8531.

Clammy, viscid, sticky. Boerhaávia viscósa, s. 109.
Clathrate, latticed, divided like latticework. Solénia compréssa, s. 15270
Clavate, club-shaped. Curcíma comósa, s. 85.
Clavellose, clubbed, or having club-like processes.
Chóndria clavellósa, s, 15240 .
Clavus, a name for the ergot, a disease in corn. Festuca duriúscula, g. 182. (note.)
Claws, (269) the taper base of a petal. Cánna limbáta, s. 8.

Clinandrium, \({ }^{63)}\) that part of the column of orchideous plants in which the anther lies. Listéra, g. 1876. p. 749.

Clypeate, (64) shaped like a Roman buckler. Tupistra, g. 757. p. 238.
cobwebbed, covered with loose hairs, as if with a cobweb. Anacámpseros arachnoides, s. 6630.
Cochleate, (65) resembling the shell of a snail. Rhéxia, g. 900. p. 300.
Cohering, connected. Prótea, g. 231. p. 77.
Collapsion, the act of closing or falling together. Sphæ'ria hydróphora, s. 16436.
Columella, (66) the axis of the fruit of mosses. p. 874.
Columnar, formed like columns. I'xia fucáta, s. 623.
Comminuted, pulverised or pounded. Línum, g. 701. (note.)
Comose, this term is used to express a kind of inflo. rescence, which is terminated by sterile bracteæ. Maránta comósa, s. 24.
Compact, close, solid. Cypérus vegétus, s. 805.
Complicate, folded together. Rhopála dentata, s. 1447.
Complicato-carinate, folded together so as to form a sort of keel, Fontinális antipyrética, s. \(148+8\).
Compound, used in botany to express the union of several things in one: thus, a compound umbel is formed by several simple umbels, a compound flower by several simple flowers, \&c. Alpinia nútans, s. 43.
Compressed, pressed together. Salicórnia, g. 22 p. 1. Concave, hollow. Zingiber mioga, s. 54.
Concentric, points or lines at equal distances from a common centre. Étrycles amboinénsis, s. 4077.
Concrete, hardened or formed into one mass. O rnus, g. 69. (note.)

Cone, ( \(\kappa 7\) ) a particular kind of compound fruit. \(\mathbf{P e}\) tróphila, g. 229. p. 76.
Conferruminate, united together, so as to be undistin. guishable. Olýnthia, g. 1124. p. 409.

Cenfervoid, like confervæ. Sporóchuus, g. 2321. ?. 926.
Confluent, running into one another, Jasminum grandifiórum, s. 181.
Cunglobated, collected into a spherical form. Daerymýces morifúrmis, s. 16300.
Conical, (68) resembling a cone. Hedýchium heteromállum, s. 16300.
Conico-hemispherical, (69) between conical and round. Brýum cuspidátum, s. 14830.
Conico-ovate, (70) between conical and ovate. Pinus sylvéstris, s. 13502.
Conjugate, ( \({ }^{71}\) ) joined in pairs: a term chiefly applied to leaves. Piper cuneifolium, S. 524.
Connate, (72) joined together at the base. Calceolaria parália, s. \(3: 0\).
Connivent, (73) converging, Loelingia, g. 82. p. 30.
Conoid, cone-like. Siléne conoídea, s. 6223.
Constricted, (74) tightened or contracted in some particular place. Salix lanceoláta, s. 13691.
Converging, approaching together. Datúra férox, s. 2164.

Convex, rising in a circular form. Piper rubéllum, s. 543.

Convexo plane, plane on one side, convex on the other. Cárex vulpina, s. 13084.
Convolute, (75) rolled together. Crócus, g. 93. p. 30.
Coralloid, like coral. Chóndria kalifórmis, s. 15291.
Cordate, heart-shaped. Cánna variábilis, s. 9.
Coriaceous, leathery. Chionánthus virginicus, s. 152.
Corneous, horny, of the consistence of horn. Sphærocóccus córneus, s. 15301.
Corniculate, having processes like small horns. Mesembryánthemum procúmbens, s. 7251.
Cornute, horned. Eucaly̆ptus cornúta, s. 7003.
Corona, (76) literally a crown : applied in botany to the crown-like cup which is found at the orifice of the tube of the corolla in Narcissus, Pancrátium, and others. Brodiæ'a, g. 114. p. 31.
Corpuscle, a small body; a particle of any thing. Secamóne, g. 577. p. 114.
Corroborant, strengthening, having the power to give strength. Melíssa, g. 12i8. (note.)
Corrosive, having the power of wearing away. Sapindus, g. 926. (note.)
Corrugated, wrinkled or shrivelled. Paspalum stoloniferum, s. 926.
Cortical, of or belonging to the bark. Linum, g. 701. (note)
Corymb, (77) a raceme or panicle in which the stalks of the lower flowers are longer than those of the upper, so that the fowers themselves are all on the same level. Centránthus ráber, s. 110.
Corymbose, formed or arranged after the manner of a corymb. Lopézia coronáta, s. 103.
Corymbulose, formed or arranged in many small co. rymbs. Crássula corymbulúsa, s. 3887.
Cosmefic, beautifying. Dipsácus, g. 262. (note.)
Coste literally ribs: applied by botanists sometimes to the midrib of a leaf, and sometimes to any projecting round elevations having the same direction as the axis of the fruit. Morchélla, g. 2386. (note.)
Costate, ribbed. Jungermánnia furcáta, s. 15004.
Cotyledons, (78) seed leaves. Hórdeum, g. 210. (note.)
Cowled-leaved, a thing is said to be cowled or cucullate when its end is curved inwards in such a manner as to represent the cowl or hood of a monk. Lachenália bifólia, s. 4898.
Crena, notches. Saxífraga umbrósa, s. 6063.
Crenate, (79) notched. Cánna limbáta, s. 8.
Crenoture, the notching. Prásium minus, s. 8518.
Crenulate, full of notches. Sálvia pomifera, s. 370.
Crest, (80) applied to some elevated appendage terminating a particular organ: a stamen is crested when the filament projects beyond the anther, and becomes dilated. Kæmpféria, g. 12, p. 1.
Cribyiform, riddled with holes like a sieve. Peziza cribrósa, s. 16265.
Cribrose, perforated like a sieve. Parinárium, g. 870. p. 297 .

Crisp, when leaves are very much undulared at the
margin, they are called crisp or curled, Cóstus villosissimus, s. 66.
Cruciate, (81) shaped like a Maltese cross: a flower is said to be cruciate when four equal petals are placed opposite each other at right angles. Gentiana septémfida, s. 3360.
Cruciferous, the name of a particular family of plants bearing cruciate flowers. p. 536.
Crustaceous, having a hard brittle shell. Hellénia, g. 9. p. 1 .

Crystalize, consisting of, or resembling, crystals. Mesembryánthemum lanceolátum, s. 7382 .
Cucullate, (82) hooded, cowled; see Cowled. Calathéa, g. 3. p. 1

Culm, the stem of grasses, scitamineous plants, and the like. Maránta arundinácea, s. 18.
Culmiferous, producing culins. Triticum spélta, s. 1235.

Ciultrate, (83) shaped like a pruning-knife. Crássula cultráta, s. 3880 .
Cuneate, wedge-shaped. Tełcrium cubénse, s. 8117.
Cup, the same as corona; see that word, g. 711. p. 236.

Cupule, (84) the cup of an acorn, and of all amentaceous plants. p. 1017.
Cupuliform, or Cupulate, shaped like a reversed bell. p. 982.

Cuspidate, (85) like the point of a spear, a leaf is cuspidate, when it is suddenly tapered to a point. Tritónia rósea, s. 664.
Cutaneous, relating to the skin. Scabiosa, g. 264. (note.)
Cuticle, the scarf skin, or epidermis. Chára, g. 2295. (note.)
Cut-toothed, (86) cut and toothed at the same time. Plantágo macrorhiza, s. 1708.
Cyathiform, cup-shaped, concave. Narcissus pul. chéllus, s. 4025.
Cylindraceous, having the form of a cylinder. Dicránum Scottiánum, s. 14744.
Cylindrical, cylinder-shaped. Salicórnia rádicans, s. 116.

Cylindrico-campanulate, cylindrically bell-shaped. Encalýpta, g. 2222. p. 896.
Cymb̂form, (87) boat-shaped. Vallésia glábra, s. 2456.
Cyme, (88) a mode of inforescence, resembling a flattened panicle. Scirpus lacuistris, s. 8 til.
Cymose, flowering in cymes. Róchea cymósa, s. 3866.

\section*{D.}

Decandrous, having ten stamens. Phytolácca abyssinica, s. 6573.
Deciduous, falling off. Leaves which are shed annually are said to be deciduous: as are also trees that annually lose their leaves. O'lea excélsa, s. 141.

Declinate, curved downwards. Zíngiber zerúmbet, s. 56 .

Decoction, a preparation or digest by boiling water. Cúnila, g. 58. (note.)
Decompound, (89) a leaf is said to be decompound when it is twice pinnated; a panicle when its branches are also panicled. Linociéra compácta, s. 474.
Decorticated, disbarked. Amýgdalus, g. 1128. (note.)
Decumbent, lying down. Chloránthus inconspicuus, s. 121.

Decurrent, (90) running down. Lopézia coronáta, s.103.
Decursive, having a tendency to run down. Actinótus heliánthi, s. 3591.
Decussated, when two right lines cross each other at right angles they are said to decussate; leaves are often placed in this position. Ixóra parviflora, s. 1746.

Deflexed, turned downwards. Schizánthus pinnátus, s. 272.

Dehiscent, (91) gaping; an expression applied to the mode in which the anthers or the fruit burst open and discharge their contents. p. 896.
Deliquescent, melting away upon exposure to air. p. 979.

Delta-leaved, Delloid, (92) shaped like the Greek \(\Delta\). Mesembryánthemum, g. 1146. p. 437.
Demulcent, having the property of softening any thing. Málva, g. 1472. (note.)
Dentate, (93) having the margin divided into incisions resembling teeth. Verónica acúta, s, 196.
Dentato-ciliate, having the margin dentate and tipped with ciliz. Sónchus arvensis, s. 11106.
Dentato-sinuate, (94) scolloped and toothed. Hypochæ'ris glábra, s. 11319.
Denticulate, being finely dentate. Circæ'a lutetiána, s. 487.

Denticulations, small toothings. Bossiæ'a scolopéndrium, s. 10121.
Dentiforn, tooth-shaped. Barbaréa plantagínea, s. 8980.

Dentrifice, powder made to scour the teeth. Acácia, g. 2127. (note.)

Deobstruent, having the power of removing obstructions, a term of medicine. Agrimónia, g. 1101. (note.)
Dependent, hanging down. Moræ'a spathácea. s, 826.
Depressed, pressed downward. Thália, g. 4. p. 1.
Depurated, purified, cleansed. \(\mathrm{O}^{\prime}\) xalis, g. 1065 . (note.)
Despumate, to throw off in froth or scum. Cecrópia, g. 2043. (note.)

Detergent, Detersive, having the power of cleansing. Physalis, g. 448. (note.)
Diundrous, having two stamens. Boerhaávia hirsúta, s. 107.

Diaphanous, transparent. Encalýpta ciliáta \(\beta\) alpína, s, 14685.
Diaphoretic, promoting perspiration. Sambácus, g. 680. (note.)

Dichotomous, (95) a stem that ramifies in pairs. Phrýnium dichótomum, s. 28.
Dicoccous, having two cocci. p. 78.
Didymous, two united. Priva mexicána, s, 8675.
Didynamous, (96) having two long stamens and two slort ones in the same flower, each pair being collateral. Stenochilus, g. 1333. p. 493.
Dietetics, relating to food or diet. Sáccharum, g. 215. (note.)
Difform, two forms; used to express irregularity. Anacámpseros rotundifúlia, s. 6629.
Diffuse, scattered, widely spread. Verónica saxátilis, s. 226.

Diffusible, such as may be spread. Amýgdalus, g. 1128. (note.)
Digitated, (97) fingered, shaped like the hand spread open. Verónica digitáta, s. 255.
Digitiform, formed like fingers. Mesembryánthemum incómptum, s. 7408.
Digynous, two styles or female organs. Sálvia crética, s. 401.

Diluent, something diluting. Melíssa, g. 1278. (note.)
Dimidiate, (98) halved, divided into two parts. p. 895.
Diccious, when a plant bears female flowers on one individual, and males on another, it is called diccious. Valeriána dioica, s. 544.
Discoid. (99) When in Compósite the florets are all tubular, the head of flowers is said to be discoid. In other cases, when the florets of the centre of a head of flowers are more perfect than the rest, they are called discoid. Finally, when any thing is dilated into something which may be compared to a disk, the term discoid is also made use of. Valerianella discoidea, s. 563.
Discus, or Disk, the fleshy annular process that surrounds the ovarium of many fowers: also the surface of a leaf; also the centre of a head of flowers of Compósitæ. 太tnóplia, g. 504. p. 113.
Discutient, having the power to scatter the matter of tumours. Artemisia, g. 1721. (note.)
Dissepiment, (100) the partitions by which a seed vessel is divided internally. Elytrária, g. 45 . p. 9.
Distichous, (101) two-rowed: producing leaves or flowers in two opposite rows. Scho'nus, g. 119. p. 31 .

Ditrichotomous, (102) divided in twos or threes; a stem continually dividing into double or treble ramifications. Trichódium canínum, s. 1001.

Diuretic, having the power of promoting the flow of urine. Bromelia, g. 726. (note.)
Divaricate, growing in a straggling manner. Verónica pinnáta, s. 219.
Dodecandrous, having twelve stamens. Rivina dodecándra, s. 1511.
Dolabriform, (103) axe-shaped. StizolÓbium, g. 1551. p. 599.

Dorsal, growing on the back. Kæmpféria rotanda, s. 67.

Drastic, applied to medicines which act violently. Dictámnus, g. 997. (note.)
Drupe, (104) a kind of fruit consisting of a fleshy succulent rind, and containing a hard stone in the middle. O'lea, g. 52. p. 9.
Dyspepsia, difficulty of digestion. Artemisia, g. 1721. (note.)

\section*{E}

Echinated, (105) covered with prickles like an echinus or bedgehog. Amómum subulátum, s. 79.
Edible, eatable. Eleusine, g. 200. (note.)
Effuse, (106) literally poured forth; applied to inflorescence, it means a kind of panicle with a very loose one-sided arrangement. Juncus effúsus, s. 4327.
Electuaries, a medicine of conserves and powders in the consistence of honey. Prúnus doméstica, s. 7045.

Elephantiasis, a disease in which the limbs become prodigiously swollen and finally fall off. Smilax, g. 2081. (note.)

Ellipsoid, (107) like an ellipsis. Nastúrtium amphíbium, s. 8970.
Elliptic-lanceolate, (108) a form between elliptical and lanceolate. O'ea americína, s. 140.
Elongated, lengthened. Cánna gigantéa, s. 6.
Emarginate, (109) having a small notch in the end. Cánna coccínea, s. 3.
Embossed, (110) projecting in the centre like the boss or umbo of a round shield or target. Prútea umbonális, s. 1327.
Embracing, (13) a leaf is said to embrace a stem when it clasps it round with its base. Sálvia amplexicaúlis, s. 428.
Emetic, that which produces vomiting. Primula vulgáris, s. 2020.
Emmenagogue, any medicine that promotes menstruation. Ligústicum, g. 665. (note.)
Emollient, softening. Triumfétta, g. 1087. (note.)
Emulsions, medicines made of bruised oily seeds and water. Amýgdalus, g. 1128. (note.)
Ensate, or Ensiform, (111) shaped like a sword with a straight blade. A'loe cándicans, s. 4444.
Epidermis, the outer skin of the bark. Lafrus, g. 934. (note.)

Epiphyllous, (112) growing upon a leaf, Jungermánnia epiphýlla, s, 15003.
Epiphytes, plants which grow upon other plants without deriving any nutriment from them. Catasétum, g. 1889. (note.)

Equidistant, equally distant. Ægopódium, g. 652. p. 116.

Equilateral, having equal sides. Aloe reticuláta, s. 4392.

Equitant, (113) a mode of vernation, or of arrangement of leaves with respect to each other, in which the sides or edges alternately overlap each other. More'a iridioides, s. 827.
Erecto-patent, between erect and spreading. Dicrá num glaúcum, s. 14715.
Eroded, (114) gnawed, bitten; a term used to express a particular kind of irregular denticulation. Sálvia pinnáta, s. 377.
Eroso-dentate, the toothing being eroded. Lycopódium clavătum, s. 14632.
Errhine, promoting a discharge of mucus from the nostrils. A'sarum, g. 1072. (note.)
Escharotic, having the power to scar or burn the skin. Juniperus, g. 2113. (note.)
Esculent, good for food. Oxystélma esculéntum, s. 3226 .

Estuaries, arms of the sea, mouths of a river. Polygonum amphíbium, s. 5568.
Etiolated, whitened by being kept from air and light. Triticum spélta, p. 70. (note.)
Evanescent, quickly vanishing. Herácleum, g. 672. p. 117.

Evolved, unfolded. Aneiléma, g. 89. (note.)
Excavated, hollowed out. Borágo, g. 340. p. 109.
Excentrical, (115) flying off from the centre. Agáricus ulmárius, s. 15924.
Excoriate, stripped of the bark or skin. Bromélia Karátas, g. 726. (note.)
Excurrent, projecting or running beyond the edge or point of any thing. Tórtula subuláta, s. 14751.
Exotic, foreign. p. 1.
Expectorant, any thing that promotes the discharge of mucus from the chest. Sambúcus nigra, p. \(22^{\circ}{ }^{\circ}\). (note.)
Exserted, (116) projecting beyond something else. Jasminum revolutum, s. 179.
Exsiccated, dried up. Papáver, g. 1170. (note.)
Extra-axillary, above or on the outside of the axils. Mesembryánthemum, g. 1146. (note.)
Extra-foliaceous, away from the leaves, or inserted in a different place from them. Echítes bispinósa, s. 2360 .

Exuvie, whatever is cast off by plants or animals. Cáctus, g. 1111. (note.)

\section*{F.}

Facula, the nutritious powder of wheat or of other things. Codárium, g. 30. p. 8.
Falcate, or Falciform, (117) bent like a sickle. Dactyloctenium, g. 201. p. 33.
Falcato-secund, bent on one side like a sickle. Dicránum longifólium, s. 14717.
Falsely two-valved, having two valves which are not of the same nature as other valves. Hákea, g. 240. p. 77 .

Farinaceous, full of flour. Triticum, g. 206. (note.)
Fascicles, parcels or bundles. Maránta oblíqua, s. 19.
Fasciculate, (118) arranged in bundles or parcels. Aspálathus, g. 1528. (note.)
Fastigiate, (119) tapering to a narrow point like a pyramid. Salicórnia proć́mbens, s, 118.
Fauces, (120) the jaws; the gaping part or orifice of a monopetalous flower, Acácia, g. 2127. (note.)
Favose, (11) pitted or excavated like the cells of a honeycomb. Thríncia, g. 1633. p. 661 .
Feathery, resembling a feather. Arundinària, g. 219. p. 35.

Febrifuge, efficacious in moderating fever. Swieténia febritưga, s. 5867.
Feculent, muddy, thick with sediment. Aloe, g. 770. (note.)
Fecundation, the act of making fruitful. Jasione, g. 547. (note.)

Feroces, (121) thickly set with spines, p. 443.
Ferruginous, iron-colored, rusty. Sidéritis, g. 1252. (note.)
Fibrillose, (122) covered with little strings or fibres. p. 989.

Fibrous, (123) being composed of fibres. Scírpus multicaúlis, s. 858.
Fiddle-lipped, (124) having a lip resembling the figure of a fiddle. Zingiber pandurátum, s. 53.
Filiform, shaped like a thread. Mantisia, g. 16. p. 1.
Fimbriate, (125) fringed. Eleusíne, g. 200. p. 33.
Finger-parted, (97) divided into lobes having a fanciful resemblance to the five fingers of a human hand. Verónica vérna, s. 254.
FFiztular, or Fistulous, hollow like a pipe. Monárda média, s. 356.
Flaccid, feeble, weak. Cánna fláccida, s, 15
Flexile, capable of being bent in different directions, pliable. Paullínia, g, 923. (note.)
Flexuose, having a bent or undulating direction. Alpínia cardamómum, s. 48.
Flexuose-recurved, bent backward in a flexuose or undulated manner. Dicránum críspum, a. 14723.

Flocci, little tufts like wool. p. 983
Florce horologice, flowers which expand at particular hours, whence they are a sort of timekeepers. Ana. gallis, g. 35\%. (note.)
Floral envelopes, the calyx, bracteæ, and corolla, which envelope the inner parts of the flower are all so called. p. 1.
Florets, (126) little flowers; chiefly applied to those which constitute what were formerly called compound flowers. Festúca vivípara, s. 1093.
Floriferous, that which bears flowers. Cólchicum, g. 851, (note.)

Flosculous, compound flowers, consisting of many tubulose monopetalous florets. Cárduus, g. 1663. p. 680 .

Foliaceous, (127) having the form of leaves. Pincknéya, g. 4y2. p. 113
Follicle, (128) a particular kind of seed-vessel. Hákea, g. 240. p. 177.

Footstalks, (129) the stalks of either flowers or leaves. Avéna, g. 171. (note.)
For-nicate, (130) arched. Roscóea, g. 7. p. 1.
Fragmentary, composed of fragrents. Lecidéa microphýlla, s. 15440.
Fringed, (125) having a border like a fringe. Cánna glaúca, s. 16.
Frond, the leaves of palms. Sábal, g. 855. p. 292.

Frontal, that which is in front, Kæmpféria rotúnda, s. 67.

Frosted, (131) covered with glittering particles, as if fine dew had been congealed upon it. Anomathéca, g. 106. p. 31.
Fructification, all those parts composing the flower and fruit of plants. Póa alpina. p. 67 . (note.)
Frutescent, or Fruticose, shrubby. Piper, g. 77. (note.)
Fugacious, that which lasts but for a short time. Utriculária, g. 53. (note.)
Fulvous, tawny yellow or fox-colored. Sanseviéra fulvo cíncta, s. 4545.
Fungous, having the substance of fungi or mushrooms. Cachrys, g. 677. p. 177.
Funicle, (132) the little stalk by which a seed is attached to the placenta. Cardámine, g. 1392. p. 536. Furcate, forked. A'juga furcáta, s. 8099.
Furfuraceous, scaly, mealy, scurfy. Agáricus granulósus, s. 15745.
Fuscous, blackish-brown. Bránia ericoídes, s. 3005.
Fusiform, (133) spindle-shaped. Selinum palustre, s. 3669.

\section*{G.}

Galeate, (134) helmeted; the upper lip of a ringent corolla is the galea of that corolla. Tourettia, g. 1299. p. 492.

Gelatine, jelly ; a term of chemistry. p. 994.
Gelatinous, consisting of jelly. Chrysophýllum, g. 424. (note,)
Geminate, doubled. Didýmodon, g. 2230. (note.)
Gemmax, (135) leafy buds as distinguished from alabastra or flower buds. Brýum, g. 2240. (note.)
Geoponic, relating to agriculture. Columélia, g. 1785. (note.)
Germ, or Germen, the old name of the ovarium. Muscári, g. 821. (note.)
Germen inferior, (136) fruit below the flower. p. 1.
Germination, the first act of vegetation in a seed. Tríticum spélta, p. 70. (note.)
Gibbous, protuberant. Maránta gíbba, s. 23.
Glabrous, smooth. Aspérula lævigáta, s. 1641.
Gladiate, (111) shaped like a short straight sword. Erýngium aquáticum, s. 3495.
Glandular, having glands. Schwénckia, g. 42. p. 9.
Glaucescent, or Glaucine, having something of a bluish hoary appearance. Mesembryánthemum glaucéscens, s. 7273.
Glaucous, having a decided hoary grey surface, Cánna gla áca, s. 16.
Globose, or Globular, (136) round or spherical. Pinguícula lusitánica, s. 322.

Glochidate, having hairs, the ends of which are split and booked back, so that the hook is double. Thrincia híspida, s. 11175.
Glomerate, (137) gathered into a round heap or head. Conýza glomeráta, s. 11850.
Glottis, the throat. Acácia, g. 2127. (note.)
Glumaceous, plants are said to be glumaceous when their flowers are like those of grasses. Cládium, g. 74. p. 11.

Glume, (138) a part of the floral envelopes of a grass. Anthoxánthum, g. 76. p. 11.
Gluten, a chemical principle. Triticum, g. 206. (note.)
Glutinous, adhesive. Sálvia glutinósa, s. 398.
Grained, (139) the segments of the flowers of Rumex have tubercles which are called grains. Rúmex patiéntia, s. 4997.
Graniform, formed like grains of corn. Mesembryánthemum parvifólium, s. 7441.
Granular, covered as if with grains. Gálium ánglicum, s. \(161 \%\).
Gregarious, herding together. Agáricus fúsipes, s. 15857.

Grooved, furrowed, channelled, marked with grooves. Catcalis, g. 626. p. 115.
Grumous, clubbed, knotted, contracted at intervals into knots. Aconítum napellus, g. 1205. (note.)
Gynandrous, (140) having the stamens and style combined in one body. O'rchis, g. 1859.
Gyrose, turned round like a crook. Urédo gyrósa, s. 16640 .

\section*{H.}

Habir, features or general appearance of a plant. Diclíptera, g. 48. p. 9.
Hamorrhages, copious bleeding. Acácia, g. 2127. (note.)
Hemorrhoid, a kind of disease. Ornithógalum, g. 802. (note.)

Hastate, (141) formed like the head of a halbert. Sálvia canariénsis, s. 372.
Hastato-lanceolate, between halbert shaped and lanceolate. Dicránum várium, s. 14728.
Hastato-sagittate, between halbert-shaped and arrowshaped. A'rum maculátum, s. 13472.
Haulm, dead stems of herbs. Dioscorea, g. 2085. (note.)
Helmet, (134) the same as Galea; see Galeate. Monárda, g. 60. p. 10.
Herbaccous, a plant the stem of which perishes annually. Maránta arundinácea, s. 18.
Hermaphrodite, consisting of two sexes. Hippuris, g. 23. (note.)

Hexagonal, six.sided. I'ris ochroleáca, s. 782.
Hexandrous, (142) having six stamens. Gardénia hexándra, e. 2834.
Hexangular, six-angled. I'ris graminea, s. 795.
Hexapetalous, having six petals. Furcræ'a cubénsis, s. 4105.

Hilum, (143) the scar or mark on a seed which indicates the place by which it adhered to the placenta. A'chras, g. 427. p. 111.
Hirsute, rough with soft hairs. Pánicum miliáceum, s. 948.

Hispid, rough with stiff hairs. Justícia ciliáris, s. 288.

Hoary, covered with white down. O'lea oleáster, 3. 135.

Homogeneous, having a uniform nature, or principle, or composition. Draparnáldia ténuis, s. 15105.
Honey-pore, (144) the pore in flowers which secretes honey. Geissorhiza rochénsis, s. 646.
Honey-scales, (145) the scales in flowers which secrete honey. Cotylédon, g. 1060 . p. 341.
Honey-spots, the spots in flowers which secrete honey. Ríta, g. 998. p. 339
Hooded, (130) being curved or hollowed at the end into the form of a hood. Hippocratea, g. 83. p. 30.
Horn, (146) any long subulate process in a flower is called a horn. Zingiber, g. 10. p. 1.

Husks, the dry envelopes of either flowers or fruits. Sporóbolus, g. 159. (note.)
Hyaline, crystalline, transparent. Diatóma, g. 2260. p. 924.

Hybrid, mule; partaking of the nature of two species. Syringa chinénsis \(\delta\) rothomagénsis, s. 161.
Hydragogue, that which removes dropsy. Euphórbia, g. 1103: (note.)

Hygrometrical, indicating the approach of moisture. Avéna stérilis, p. 60. (note.)
Hypercatharsis, a medicine that produces too powerful effects as a purgative. Verátrum, g. 2128. (note.)
Hypocrateriform, salver-shaped, Galipéa, g. 41. p. 9.
Hypogynous, (147) situated below the ovarium. Serrúria, g. 234. p. 77.
Hypophyllous, (148) under the leaf. Erineum gríseum, s. 16592.

\section*{1.}

Iced, (131) covered with particles like icicles. Mesembryánthemum pisiforme, s. 7210 .
Ice-drops, transparent processes resembling icicles, Mesembryánthemum glaciále, s. 7377.
Imbricate, (149) laid one over another like tiles. Maránta oblíqua, s. 19.
Incised, (150) cut, separated by incisions. Verínica austriaca, s. 239.
Incrassated, (151) becoming thicker by degrees. Tétraphis Browniána, s. 14682.
Incurved, bending inward. Roscóea, g. 7. p. 1.
Incurve-recurved, bending inwards and then backwards. Mesembryánthemum lineolátum, s. 7302.
Indehiscent, not dehiscing. Néslia, g. 1426. p. 537.
Indigenous, native of a country. Crócus, g. 93. (note.)
Indurated, hardened. Milium, g. 141. p. 32.
Indusium, (152) the membrane that encloses the theca of ferns. Polybótrya, g. 2168. p. 876.
Inflated, blown up. Amómum sylvéstre, s. 78.
Inftexed, bending inward. Dicliptera, g. 48. p. 9.
Iuflorescence, disposition of flowers, Chloranthos, g. 25. (note.)

Infundibuliform, funnel-shaped. Tritónia fenestráta, s. 672.

Innocuous, harmiess. Gomphocárpus, g. 587. p. 115.
Inspissated, thickened; spoken of sap or other liquor. A'tropa, g. 446. (note.)
Intenerating, having the power of making tender or softening. Cárica, g. 2095. (note.)
Internodes, the space between the joints of plants. Bambúsa, g. 752. (note.)
Interpetiolar, between the petioles or leafstalks. Microlóma, g. 578. (note.)
Interstices, spaces between one thing and another. Pimpinélla, g. 635. p. 116.
Intramarginal, within the margin. Listéra, g. 1876. p. 749.

Inverse, inverted. Sántalum, g. 307. p. 79.
Involucels, (153) the partial involucra of umbelliferous plants. Caúcalis platycárpos, s. 3528.
Involucral, having an involucre. Ammébiums g. 1681. (note.)
Involucrated, covered with an involucre. Penicillárıa, g. 148. p. 32.

Involucre, or Involucrum, (154) the bracteæ which surround the flowers of Umbellifers in a whorl. Caúcalis platycárpos, s. 3528.
Involute, rolled inwards. Moræ'a, g. 116. p. 31.

\section*{J.}

Joints, the places at which the pieces of the stem are articulated with each other. Boerhaávia erécta, s. 105.

Juliform, (155) formed like an amentum or catkin. Brýum iuláceum, s. 14816.

Kaliform, formed like Sálsola káli, a sea-coast plant. Chóndria kalifórmis, s. 15291.
Keel, (51) when the midrib of a leaf or petal is sharp and elevated externally it is called a keel. p. 31.
Kneed, or Knee-jointed, bent like the knee-joint. A conítum tortuósum, s. 7867.

\section*{L.}

Labellum, (156) the front segment of an orchideous or other flower. Ionópsis, g. 1919. p. 750.
Lacinice, segments of any thing. Parmélia cyclosélis, s. 15581.

Laciniate, cut or divided into segments. Phlómis laciniáta, s. 8365.
Lactescent, yielding milky juice. Maclúra aurantíaca, s. 13256 .

Lacunce, little pits or depressions. p. 948.
Lacunose, covered with little pits or depressions. Helvélla crispa, s. 16200.
Levigated, smoothed. OEnothéra glaúca, s.. 5459
Lamellated, (157) divided by plates internally. Músa, g. 721. (note.)

Lamina, literally a plate; it is mostly applied to the leaf of a plant considered without its petiole. Béta cícla. p. 207. (note.)
Lanceolate, (158) lance or spear shaped. Cóstus, g. 11. p. 1.

Lanceolato-subulate, between lanceolate and subulate. Sphágnum cuspidátum, s. 14653.
Lateral, on one side. Alpinia nútans, s. 43.
Lax, loose, not compact. Zíngiber róseum, s. 59.
Leaflets, (159) small parts of compound leaves. Codârium acutifólium, s. 133.
Legume, or Legumen, (160) a pod; the fruit of leguminous plants. Gompholóbium, g. 954. (note.)
Leguminous, plants which bear legumes, such as the peas the bean, the kidneybean. p. 8 ,
Lenticular, shaped like a lens. Kyllinga, g. 129. p. 31.

Lentiform, in form like a lens. Rivina, g. 253. p. 78.

Leprous, covered with spots or scales. Rhododén dron ferrugineum, s. 5923.
Lid, (161) the calyx which falls off from the flower in a single piece. Eucalýptus, g. 1126. p. 409.
Ligula, (162) the membrane at the top of the petiole of grasses and other plants. Zingiber panduratum, s. 53.

Ligulate, (163) strap-shaped. Aneiléma sinicum, s. 595.
Limbate, having a colored or dilated surface. Eríca oppositifólia, s. 5265
Lirear, when the two sides are parallel. Cánna, g. 1. p. 1.

Linear-ensate, long sword-shaped. Márica califórnica, s. 833.

Linguiform, or Lingulate, (164) tongue-shaped. Hæmanthus coccineus, s. 4149.
Lipped, (156) having a distinct lip or tabellum. Roscóea, g. 7. p. 1.
Lithontriptic, having the power of breaking the stone in the bladder. p. 1075.
Lobelets, (165) small lobes. Geránium sanguíneum, s. 9644.

Lochiol, relating to the natural discharges consequent upon childbirth. Aristolóchia, g. 1934 (note.)
Loccmotion, motion from place to place. Mimósa, g 2124. (note.)
Loculaments, partitions or cells of a seed vessel. Cystoséira, g. 2329. p. 927.
Locular, (166) a fruit is called unilocular if it contains but one cell ( \(a\) ), bilocular if two cells ( \(b\) ), trilocular if three (c), and so on. Fédia, g. 72. p. 11.
Loment, (167) a kind of legume falling in pieces when ripe. Mulléra, g. 1567. p. 597.
Lomentaceous, bearing pericarpia, called lomenta. Erucária, g. 1445. p. 539.
Lorate, (163) shaped like a thong or strap. Pancrátium littorále, s, 4062.

(a)

Lubricate, to make slippery. Acácia, g. 2127. (note.) Lucid, bright, shining. Sálvia lineatifólia, s. 399.
Lunate, or Lunulate, (168) shaped like a half moon. Céstrum auriculátum, s. 2465 .
Lurid, a color between purple, yellow, and grey. Moræ' a lúrida, s. 828.
Lymphatic, of or belonging to lymph or sap. p. 874.
Lyrate, (169) lyre-shaped. Sálvia lyràta, s. 450.

\section*{M.}

Macerate, to decompose by steeping in water or other liquid. Méntha, g. 1254. (note.)
Marginal, relating to the margin. Hellénia, g. 9. p. 1.

Masticatory, grinding or chewing with the teeth. Pimpinélla, g. 635. (note.)
Math, an old term for crop. Alopecúrus, g. 164. (note)
Matrix, a place where any thing is generated or formed. Calothrix, g. 2286. p. 925.
Medulla, the pith of a plant. p. 1053.
Medullary, relating to the pith of plants. Mimósa, g. 2124. (note)

Melastomaceous, partaking of the nature or appearance of Melástoma. p. 300.
Melliferous, honey-bearing. Anchúsa, g. 332. (note.)
Membranaceous, or Membranous, having the texture of a membrane. Chionánthus marítima, s. 153.
Menstruum, a liquor used as a dissolvent. Ranúnculus, g. 1233. (note.)
Meshes, the openings in any tissue. Mougeótia, g. 2290 , p. 925.

Micacious, glittering, shining. Watsónia, g. 101. (note.)
Mid \(), b,(170)\) the large vein which passes from the petiole to the apex of a lcaf. Póthos, g. 252, (note.)
Miliary, granulate resembling many seeds. Cítrus médica, p. 655. (note.)
Mitriform, (171) formed like a mitre, p. 895.
Mobility, the power of motion. Mimósa, g. 2124. (note.)
Monadelphous, (172) having the filaments cohering in a tube. I'xia monadélpha, s, 629.
Monandrous, (173) having one stamen. Alchemilla A'phanes, s. 1519.
Moniliform, fonned like a necklace, that is to say, with alternate swellings resembling beads and contractions. Helióphila amplexicaúlis, s. 9312.
Monocotyledons, having one seed leaf. p. 236.
Monocious, having the one sex in one flower, and the other in another. Schoe'nus monoícus, s, 847 .
Monopetalous, having one petal p. 9.
Monosepalous, having one sepal or division of the calyx. Pontederia, g. 730. p. 237.
Mordant, that which enables vegetable matter or tissue to receive dyes or coluring matter, and to retain them. p. \(106 t\).
Mottled, marked with blotches of color of unequal intensity passing insensibly into each other. Syringa pérsica, s. 162.
Mucilage, a turbid slimy fluid. Sálvia, g. 62. (note.)
Mucronate, (174) pointed sharp. Corispérmum intermédium, s. 127.
Mucronulate, having a little hard point. Bánksia integrifúlia, s. 1459.
Mulch, a gardener's term for the placing manure about the roots of trees on the surface of the ground. Rósa, g. 1148. (note.)
Multifarious, very numerous; or arranged in many rows. A'loe rígida, s. 4387.
Multipartite, much divided. Pterónia stricta. s. 11492.
Multiplex; much multiplied. Selágo fasciculáta, s. 8657.

Muricated, covered with short sharp points. Pánicum muricátum, s. 949.
Muricato-hispid, covered with short sharp points and rigid hairs or bristles. Bryónia scabrélla, s. 13588.

\section*{N.}

Naiades, nymphs of the springs and fountains; a particular order of Monocotyledonous plants. p. 772. Narcotic, producing sleep or torpor. Brómus, g. 184. (note.)
Navicular, (175) boat-shaped. Airópsis, g. 160. p. 32. Neck, the upper tapering end of bulbs is called the neck. Crínum sumatránum, s. 4184.
Nectariferous, bearing honey. Swértia, g. 599. p. 115. Nectary, or Nectirium, \((144,145\).\() that part of a\) flower which produces honey. Alpinia Allíghas, s. 51.

Nerves, the strong veins upon leaves or flowers. Cánna rubricaúlis, s. 11.
Nermimotion, the power of motion in leaves. Mimósa, g. 2124. (note.)

Nervose, or Nervine, composed of nerves. Eránthemum pulchéllum, s. 312.
Neuter, neither male or female. Anthoxánthum, g. 76. p. 11.

Nidulant, nestling; lying among any thing as a bird in its nest. Samýda, g. 1034. p. 340.
Nidus, the nest of any thing. Alcyonidium, g. 2267. (note)
Nodding, (177) having a drooping position. Verónica complicata, S. 190.
Nodi, (178) the articulations of plants: the place where one joint is articulated with another. Sporóchnus villósus, s. 15333.
Nodose, having many nodi or knots. Póa serótina, s. 1187.

Nodules, small hard knots. Ischæ'mum aristátum, S. 14230.

Notch-flowered, having the flower notched at the margin. Verónica crenuláta, s. 185.
Nucamentaceous, producing nuts. Búnias, g. 1444. p. 539.

Nucleus, the kernel. Myríca Fáya, s. 13869.

\section*{0.}
\(O b\) is used in the composition of Latin technical terms \({ }_{3}\) to indicate that a thing is inverted; for instance, obovate is inversely ovate, obcordate inversely cordate, and so on.
Occidental, coming from the west. Alpinia occidentális, s. 42.
Ochraceous, having the color of clay or yellow ochre. Oscillatória ochrácea, s. 15118.
Octandrous, (179) having eight stamens. Rivína octándra, s, 1511.
Octogynous, (180) having eight styles. Phytolácca octandra, s. 6572.
Officinal, any thing that is, or has been, used in the shops. Kæmpféria Galánga, s. 68.
Oleaginous, having the qualities of oil. Rivina, g. 253. (note.)

Oleraceous, esculent, eatable. Ranúnculus, g. 1233. (note.)
Olivaceous, having the qualities of olives. p. 924.
Opercular, (161) covered with a lid. p. 749.
Operculiform, having the figure and position of a
round lid of something. Operculária, g. 250. p. 78.
Operculum, (161) a lid. p. 874.
Opiate, having the power of opium. Dictámnus, g. 997. (note.)

Orbicular, or Orbiculate, a plane surface circumscribed by a circle. Farsétia, g. 1397. p. 586.
Orchideous, of or belonging to the natural order of Orchídeæ. p. 748.
Orifice, an opening. Schwénkia, g. 42. p. 9.
Ossified, become like bone. Cóix, g. 1951. p. 768.
Ova, the eggs of any thing. Palmélla, g. 2265. (note.)
Oval, having the figure of an ellipse. Corispérmum, g. 26. p. 1.

Ovarium, or Ovary, (176) the part of the flower in which the young seeds are contained. Hæmodórum, g. 111. p. 31.
Ovate, (181) egg-shaped. Maránta Tónchat, s. 22.
Ovato-acuminate, (182) egg-shaped, and tapering to a point. Cárex ovális, s. 13080.

Ovato-cylindraceous, (183) egg-shaped, with a convolute cylindrical figure. Didýmodon purpúreum, s. 14762. Ovato-deltoid, triangularly egg-shaped. Bétula álba, s. 13188.

Ovato-rotundate, roundly egg-shaped. Pháscum múticum, s. 14660.
Overlapping, when the margin of one thing lies upon that of another, it is said to overlap. Cýclamen vérnum, s. 2051.
Ovoid, (181) egg-like. Psorălea Lupinéllus, s, 10758.
Ovules, \((176)\) the young seeds of plants contained in the ovarium. Nemophila, g. 386, p. 110.

\section*{\(\mathbf{P}\)}

Palate, (184) the mouth of a ringent flower. Pinguícula edéntula, s. 327.
Paleaceous, abounding with chaffy scales. Brơmélia Karátas, s, 4114. (note.)
Palmated, or Palmatifid, (185) divided so as to resemble a hand. Curcóma Zedoária, s. 80.
Panduriform, (186) having the figure of a fiddle. Kæmpféria panduráta, s. 70.
Panicled, (187) loose-spiked. Maránta, g. 2. p. 1.
Pannary, useful for making bread. Tríticum, g. 206. (note.)
Papilionaceous, (188) butterfly-shaped flowers. p. 338
Papillose, producing small glandular excrescences like nipples. Onosmódium hispidum, s. 1930.
Pappus, (189) the crown of the fruit of Compositæ, and similar plants. Centránthus, g. 20. p. 1.
Papulose, producing small glands like pimples. Mesembryánthemum parvifólium, s. 7442.
Parabolically, in form like a parabola. A'loe brevifólia, s. 4435.
Parenchyma, all the parts of plants which consist of cellular tissue only. Solorína, g. 2331. p. 948.
Parietal, being attached to the sides of an ovarium instead of its axis. Glóbba, g. 15. p. I.
Patent, spread out or expanded. Lycopódıum annótinum, s. 14636.
Patenti-reflexed, spread out and turned back. Cárex paucifóra, s. 13069.
Patulous, slightly spreading. Centauréa babylónica, s. 12613.

Pectinate, (190) resembling the teeth of a comb. Verónica orientális, s. 237.
Pectoral, relating to the breast. Trápa, g. 308. (note.)
Pedatifid, (191) cut into lobes, the lateral ones of which do not radiate from the petiole like the rest. Saxifraga pedatífida, s, 6089 .
Pedïcellate, slightly stalked. Céstrum tinctórium, s. 2475.

Pedicels, small footstalks of flowers. Commelina cceléstis, s. 592.
Peduncle, the common footstalk of flowers. Cánna Lambérti, s. 5.
Pellicle, a thin skin. Papýrus, g. 128. (note.)
Pellucid, bright, transparent. Mesembryánthemum réptans, s. 7278.
Peltate, (192) when the petiole is fixed in the disk instead of the margin. Píper peltátum, s. 514.
Pencilled, (193) marked in lines as if with a pencil. Crócus lagenæflórus y penicillátus, s, 612.
Pendulous, drooping, hanging down. Curcama angustifólia, s. 91.
Pentagonal, having five angles. Piquéria, g. 1704, p. 663.

Pentagynous, (194) having five styles. Phytolácca abyssínica, s. 6573.
Pentandrous, (194) having five stamens. Portlándia grandifóra, s. 2622.
Pentapetalous, (194) having five petals. p. 115.
Perennial, lasting many years without perishing, Aspicárpa úrens, s. 132.
Perfoliate, (195) when the stem passes through the base of the leaf. Verónica perfoliáta, s. 251.
Perianthium, the envelope that surrounds the flower; this term is applied when the calyx cannot be distinguished from the corolla. Gomphréna perénnis, s. 3178.

Pericarp, the seed vessel. Deeringia, g. 563. (note.)
Perichatial, (196) leaves which in mosses surround the base of the stalk of the theca. p. 895.
Perigynous, (197) inserted into the calyx. Larbræ'a, g. 1069. p. 341.

Peristome, (198) the rim which surrounds the orlfice of the theca of a moss. p. 895.
Perithecium, Peridium, or Perisporium, different kinds of envelopes of the reproductive organs of Fúngi. Pyrénula, g. 2337. p. 948.
Persistent, remaining, not falling off. Codárium, g. 30. p. 8.

Pervious, having a passage through which anything can be transmitted. Primula, g. 350. p. 110.
Petaloid, like a petal. Damasónium, g. 859, p. 241.
Petals, (194) divisions of the corolla. p. 1.
Petiolate, having footstalks. Alpinia malaccénsis, s. 46

Petioles, footstalks of leaves. Císsus heterophýlla, s. 1780.

Petiolules, little petioles. Erythrina, g. 1521. (note.)
Pezizoid, like a Pezíza; a kind of fungus resembling a cup in figure. p. 1021.
Phanogamous, such plants as are visibly furnished with sexual organs. p. 108.
Phagedenic, eating, corroding; a gnawing of the stomach; also applied to ulcerous sores. A'nthemis, g. 1778. (note.)

Pharmaceutical, relating to the art of pharmacy. Astrágalus Tragacántha, p. 637. (note)
Phthisis pulmonalis, consumption of the lungs. Acácia, g. 2127. (note.)

Pileate, (199) having a cap or lid like the cap of a mushroom. Cáscuta chilénsis, s. 1811.
Pilcus, the cap of a mushroom. p. 978.
Piliferous, bearing hairs. Sphenógyne dentáta, s. 12528 .

Piliform, formed like down or hairs. Grímmia pulvináta, s. 14690.
Pilose, slightly hairy. Monárda Kalmiána, s. 363.
Pimpled, covered with minute pustules resembling pimples. Saxífraga liguláta, s. 6051.
Pinnce, or Pinnula, the segments of a pinnated leaf. Calceolária pinnáta, s. 315 .
Pinnate, (200) a leaf is so called when it is divided into numerous smaller leaves or leaflets. Codárium acutitolium, s. 133.
Pinnatifid, (201) a leaf is so called when it is divided into lobes from the margin nearly to the midrib. Centránthus calcitrápa, s. 112.
Piquancy, sharpness, pungency. Spilánthes, g. 1695. (note.)
Pisiform, formed like peas. Lagétta, g. 909. p. 300.
Pistillum, or Pistil, (202) the columnar body situate in the centre of a flower, consisting commonly of three parts, viz. the ovarium, style, and stigma. Knáppia, g. 142. p. 32.
pitchers, (203) hollow leaves so called. Nepénthes distillatória, s. 14077.
Pith, medulla occupying the centre of a stem or shoot. Mélica, g. 193. (note)
Pituitous, discharging mucus. Pánax, g. 2166. (note.)
Plane, flat. Matricária, g. 1771. p. 664.
Plano-compressed, compressed down to a flattish sur. face. Poinciána, g. 977. p. 339.
Plethoric, having a full habit. Juniperus, g. 2113. (note.)
Plicate, (204) plaited. Nicotiána repánda, s. 2206.
Plumose, (205) feathery, resembling feathers. Centránthus, g. 20. p. 1.
Plumula, (206) the young leaves in the embryo. p. 1053.
Plurilocular, (207) having many cells. p. 1085.
Pod, (160) a kind of seed vessel such as that of the pea tribe. Epimédium, g. 297. p. 79.
Polyandrous, (208) having more stamens than 20 Royéna ambigua, s. 6037.
Polygamous, a plant is said to be polygamous when some flowers are male, others female, and others hermaphrodite. Rhagódia, g. 562. p. 114.
Polygynous, (208) having numerous styles. Royéna ambígua, s. 6037.
Polypetalous, (209) having many separate petals. p. 10.

Polyspermous, (210) having many seeds. p. 1066.
Pome, an apple. Pýrus, g. 1133.
Pores, apertures in the cuticle through which transpiration takes place, Lasiopétalum, g. 523. p. 113.

Porrect, extended forward. Bauhinia auríta, s. 5768
Pouch, a little sack or bag at the base of some petals and sepals. Nigritélla, g. 1860.
Pranomen, the first name of several; in plants it is the same as the generic name. Crocus, g. 93. (note.)
Precocity, ripe before the usual time. Dáphne Mezéreum, p. 32s. (note.)
Prismatic, formed as a prism. Polycnémum arvénse, s. 599.

Processes, protrusions either natural or monstrous. Orthotrichum, g. 2233. p. 896.
Proliferous, a plant is said to be proliferous when it forms young plants in abundance about its roots. Scirpus Lúzulæ, s. 867.
Prominences, protuberant risings from the surface. Colutéa arboréscens, s. 10484.
Propendent, hanging forward and downward. Cæ'sia vittáta, s. 4831.
Prurient, stinging. p. 1061.
Pubescence, down, closely pressed to the surface. Fragária vésca, s. 7566.
Pullulating, budding. Conférva pátens \(\beta\) prolífera, s. 15177.

Pulverised, reduced to powder. Crócus, g. 93. (note.)
Pulvinate, become cushion-shaped. Grimmia pulvináta, s. 14640.
Pulvinuli, little cushions, p. 948.
Punctiform, formed like points. Pezíza punctáta, s. 16267.

Pungent, stinging or pricking. Corispérmum Redowskii, s. 126.
Pustular, or Pustulate, covered with glandular excrescences like pustules. Pelargónium pustulósum, s. 9621.

Pustules, pimples or little blisters. Brunsvigia Rádula, s. 4215
Pyriform, shaped like the fruit of a pear. Paullinia pimnáta, s. 5612.

\section*{Q.}

Quadrangular, four-angled, Dorsténia Houstóni, s. 1526.

Quadrifarious, arranged in four rows or ranks. Struthíola imbricáta, s. 1487.
Quadrifid, divided four times. Plantágo, g. 278. p. 78.
Quadriglandular, having four glands. Malpighia glandulifera, s. 6373.
Quartz, a species of stone, Laturus cinnamómum, s. 5640 .

Quaternary, succeeding by fours. p. 76.
Quaternate-pinnate, (211) pinnate; the pinnæ being arranged in fours. Anthyllis tetraphýlla, s. 10211. Quinate, in fives. Póthos pentaphýlla, s. 1506.
Quinquefid, (212) divided into tive. Císsus, g. 305. (note.)
Quintuple, five times multiplied. Ephédra, g. 2115. p. 819.

\section*{R.}

Racemes, (213) a particular arrangement of flowers, when they are arranged around a filiform simple axis, each particular flower being stalked. Alpinia nútans, s. 43.
Racemose, flowering in racemes. Verónica Barreliérı, s. 212.

Rachis, (214) that part of a culm which runs up through the ear of corn, and consequently the part that bears the flowers in other plants. Páspalum, g. 139. p. 31

Radiant, or Radiate, (215) a flower is said to be radiant, when, in a cluster or head of florets, those of the circumference or ray are long and spreading, and unlike those of the disk. Scabiusa canéscens, s. 1569.

Radical, proceeding from the root. Phrynium capitátum, s. 27.
Radicant, producing roots from the stem. Marcgraávia, g. 1163. (note.)
Radicule, (216) that end of the embryo which is opposite to the cotyledons. p. 537.
Radius, (217) the ray of compound flowers. Solidágo canadénsis, s. 12066.
Ramenta, little brown withered scales with which the stems of some plants, especially ferris, are covered. Rhodoméla lycopodioides, s. 15280.
Ramentaceous, (218) covered with ramenta. Euphórbia fragifera, s. 6793.
Ramifications, subdivision of roots or branches. Eragrústis pilósa, s. 1207.
Ramose, branchy. I'lex, g. 315. (note.)
Ramuli, twigs or small branches. Draparnáldia, g. 2284. p. 925

Raphe, in seeds this is the channel of vessels which connects the chalaza with the hilum ; in umbelliferous plants it is the line of junction of the two halves of which their fruit is composed. Búbon, g. 640. p. 116.

Rationale, the reason of a thing. Solánum, g 451. (note.)
Receptacle, (219) that part of the fructification which supports the other parts. Pollichia, g. 21. p. 1.
Recesses, the bays or sinuses of lobed leaves. Sisymbrium obtusárigulum, s. 9169.
Rectangular, right-angled. Teúcrium asiáticum, s. 8114.

Rectilinear, right-lined, Bómbax eriánthos, s. 9942.
Rectum, an intestine. A'nthemis, g. 1778. (note.)
Rccurved, bent backward. Zingiber, g. 10. p. 1.
Recurvo-patent, bent back and spreading. Grimmia apocárpa, s. 14687.
Reflexed, bent backward. Cánna gigantéa, s. 6.
Reflexed recesses, sinuses of leaves which are bent backward from the ordinary direction of the surface of a leaf. p. 165.
Refrigerant, producing coolness. Oxális, g. 1065. (note.)
Reniform, (220) kidney-shaped. Leptánthus renifórmis, s. 736.
Repand, (221) a leaf having a margin undulated and unequally dilated is said to be repand. Eranthemum bícolor, s. 313.
Repando-dentate, repand and toothed. Dorónicum Pardaliánches, s. 12189.
Repellant, that which turns you away from any thing. A'tropa, g. 446. (note.)
Replicate, folded back. Cyclópia, g. 946. (note.)
Resolutive, or Resolvative, having the power to dissolve. Argemóne, g. 1172. (note.)
Resolvent, having the power of dissolving. Curcáma, g. 14. (note.)
\(\boldsymbol{R e s t r i n g e n t , ~ a s t r i n g e n t . ~ B e ́ r b e r i s , ~ g . ~ 8 2 9 . ~ ( n o t e . ) ~}\)
Resupinate, inverted in position, so that that which was in front becomes at back. Hedychium, g. 6. p. 1.

Reticulated, resembling a net. Hákea unduláta, s. 1435.

Retuse, (222) abruptly blunt. Hedýchium fiávum, s. 36.
Revolute, rolled back. Cánna speciósa, s. 13.
Rhomboidal, (225) like a rhombus. Sálvia mexicána, s. 385 ,

Rhomboid-ovate, rhomboidally egg-shaped. Chenopódium atriplicis, s. 3416.
Rib, (170) the projecting vein of any thing. Curctima rubéscens, s. 83.
Rigid, stiff. Notelæ'a rigida, s. 157.
Ringent, (223) gaping. Justícia, g. 47. p. 9.
Ringing, making an incision resembling a ring all round a branch. Liriodéndron, g. 1216. (note.)
Rotate, (224) a monopetalous corolla, the limb of which is flat and the tube very short, is called rotate. Valerianélla discoídea, s, 563.
Rotundo-ovate, roundly egg-shaped. Cárex fúlva, s. 13123.

Rubefacient, any thing which reddens the skin, or raises slight cutaneous inflammation. Euphórlia, g. 1103. (nnte.)

Rudiment, when an organ is imperfectly developed, botanists call such developement a rudiment. Molinia, g. 194. p. 33.
Rufou's, reddish orange-colored, or rusty. Cánna glaúca \(\beta\) rufa, s. 16.
Rugose, rough or coarsely wrinkled. Calceolária rugúsa, s. 317
Rugulose, firely wrinkled. Sálvia chamædryoides, s. 386.

Runcinate, (226) hooked back, applied to the lobes of leaves. Hésperis runcináta, s, 9161.
Runcinato-dentate, hooked back and toothed. Apárgia taráxaci, s. 11166.
Runners, \({ }^{(229)}\) procumbent shoots which root at their extremity. Ranúnculus salsuginósus, s. 8037.
Rusty, rust-colored. Curcúma ferrugínea, s. 87.

\section*{S.}

Saccate, bagged; having a bag or pouch; as many petals. Calótropis, g. 584. p. 115.
Sagittate, (227) shapedlike an arrow-head. Dorsténia arifolia, s. 1528.
Salivation, a discharge of saliva from the glands of the mouth. Plumbago, g. 324. (note.)
Samara, (228) a kind of winged seed vessel; the same as what the English call key. O'rnus, g. 69. p. 11.
Sapid, agreeable to the palate. Nelímbium, g. 1213. (note.)
Saponaceous, soapy. F'sculus, g. 866. p. 296.
Sarmentose, (229) producing sarmenta or runners. Echítes bifóra, s. 2355.
Sawed, resembling the teeth of a saw. Coldenia procúmbens, s. 1833.
Scabrous, rough with little asperities. Sálvia runcináta, s. 459.
Scales, any small processes resembling minute leaves; also the leaves of the involucrum of Compósita. Pollíchia, g. 21. p. 1.
Scandent, climbing. Piper, g. 77. (note.)
Scape, (231) a stem rising from the root and bearing nothing but flowers. Maránta comósa, s. 24.
Scariose, or Scarious, membranous and dry. Bufónia tenuifólia, s. 1813.
Schistous, rocky, formed of the rock called schist. \(\mathrm{O}^{\prime}\) lea, g. 32. (note.)
Scion, a shoot intended for a graft. Caméllia, g. 1476. (note.)
Scoria, cinders. Caméllia, g. 1476. (note.)
Scrobiculate, excavated intolittle pits or hollows Antennária, g. 1795. p. 663.
Scrotiform, formed like a double bag. Ellisia, g. 432. p. 111.

Scurfy, covered with scales resembling scurf. Eustoma, g. 365 p. 110.
Scutate, formed like an ancient round buckler. PtiIóta, g. 2311. p. 925.
Secund, (232) arranged on one side only : the same as unilateral, which is better. p. 917.
Sedges, a tribe of marsh plants so called. p. 81.
Segments, parts of any thing. p. 1.
Semi-, half.
Seminal, belonging to the seed. Scabiósa, g. 264. (note.)
Semination, seeding. Crócus, g. 93. (note.)
Sepals, (233) the segments of the calyx. Sebæ'a, g. 281. p. 98.

Septa, (166) the partitions that divide the interior of the fruit. Rulingia, g. 704. p. 118.
Septiferous, bearing septa. Ramónda, g. 374. p. 110.
Serrated, (230) like the teeth of a saw. Maytenus boária, s. 134.
Serrulations, notchings like those of a saw, Agáve yuccæfólia, s. 4093.
Sessile, without footstalks. Zostéra, g. 24. p. 1.
Setaceo-rostrate, having a beak with the figure of a bristle. Cárex ampullácea, s, 13162.
Sctaceous, resembling a bristle in shape. Justícia nígricans, s, 282.
Setco, bristles. Sche'nus nígricans, s. 845.
Setiform, (234) formed like a bristle. Rósa bibérnica, s. 7501.

Setigerous, or Sefose, covered with bristles. Knáppia, g. 142. p. 32.

Sheath, the lower part of the leaf that surrounds the stem. Z Zostéra, g. 24, p. 1.
Sherds, the fragments of potting employed by gardeners to drain their flower-pots. Prótea, g. 231. (note.)
Shield, (29) a broad table-like process in the flower of
Stapélia and its allies. Huérnia clavígera, s. 3351.
Sialagogue, having the power of exciting saliva. p. 536.

Silicated, coated or mixed with flint. Astrágalus tragacántha, p. 637. (note.)
Siliceous, flinty. Laúrus cinnamómum, g. 934. (note.)
Silicle, (235) the small round pod of Cruciferæ. Lu-
nária, g. 1395. p. 536.
Silique, \({ }^{2} 2361\) the long taper pod of Cruciferæ, Brássica, g. 1439.
Simple, the reverse of compound. p. 1.
Sinuate, or Sinuose, (237) bending in and out. Lycópus europæ'us, s. 338.
Sinuato-dentate, sinuate and toothed. Leóntodon palústris, s. 11156.
Sinus, the bays or recesses formed by the lobes of leaves or other bodies. Hamamélis virginica, s. 1814.

Soboliferous, (238) producing young plants from the root. A'loe brévis, s. 4415.
Soddened, soaked. Prótea, g. 231. (note.)
Somniferous, causing sleep. Primula véris, s. 2022.
Soporific, causing sleep. Himulus, g. 2074. (note.)
Sorediferous, (239) bearing soredia. Ramalína, g. 2355. p. 949.

Sori, (152) the patches of fructification on the back of the fronds of ferns. p. 925.
Spadix, (240) a spike protracted from a spatha. Zostéra, g. 24. p. 1.
Spatha, a broad sheathing leaf enclosing flowers arranged upon a spadix. Hedýchium spicátum, s. 34.
Spathaceous, furnished with a spatha. p. 1.
Spathulate, (241) shaped like a spatula, a knife so called. Cánna gigantéa, s. 6.
Sphacelate, withered or dead. Senécio ægýptius, s. 11911.

Sphaerical, round like a sphere. Alpinia nútans, s. 43.

Spheroidal, almost like a sphere. Cáctus latispinus, s. 6852.

Spherules, (242) minute spheres. Stromatosphæ'ria concéntrica, s. 16360.
Spike, (214) flowers sessile upon a long rachis. Maránta látea, s. 20.
Spines, indurated branches or processes formed of woody fibre, and not falling off from the part that bears them. Ancístrum, g. 68, p. 10.
Spiniform, formed like a spine. Mesembryánthemum spinifórme, s. 7363.
Spirous, full of spines. Alpinia cérnua, s. 44.
Spinulescent, having a tendency to produce small spines. Mesembryánthemum spinuliferum, s. 7421.
Spinulose, covered with small spines. Rhéum Ríbes, s. 5667 .

Spiral, (253) circularly involved. Cóstus spirális, s. 65.
Sporules, that part in Cryptogamous plants which answers to the seeds of other plants. p. 874.
Spormliferous, bearing sporules. Phállus impudicus, s, 16336.
Spurious, counterfeit. I'ris spária, s. 781.
Spurs, (243) long processes resembling horns produced by various parts of the flower. Curcima, g. 14. p. 1. Squaniform, like scales. Sántalum, g. 307. p. 79.
Squarrose, (244) spreading rigidly at right angles, or in a greater degree. Zingiber squarrósum, s. 60 .
Squinancy, an inflammation in the throat. Asperrula, g. 268. (note.)

Stamen, (245) the male organ of a flower. p. 1.
Staminiferous, producing stamina. Campánula, g. 463. p. 112.

Standard, (188) the upper segment of the flower of Legumínósæ. Thermópsis, g. 944. p. 338.
Stellate, in the manner of a star. Schwénkia, g 42.

Stellulate, resembling little stars. Onosma taíricum, s. 1907.

Sterile, barren. Amómum grandifórum, s. 74.
Sternutatory, qualities which provoke sneezing. Primula vulgáris, g. 350. (note.)
Stigma, (246) the female organ of a flower. Cánna, g. 1. p. 1.

Stimulating, exciting. Cínna, g. 161. (note.)
Stimuli, stinging hairs. U'rtica árdens, s. 13230.
Stipes, \(\left(24^{7}\right)\) the stalk of Fungi. p. 978.
Stipitate, having a short stalk. Aspidistra, g. 759. p. 238.

Stipulaceous, having appendages called stipulæ. Solánum peruviánum, s. 2516.
Stipulary, occupying the place of stipulæ. Paliúrus austrảlis, s. 2896
Stipules, (248) small scales at the base of the petiole
of certain leaves. Spermacóce stylósa, s. 1653.
Stoloniferous, (249) having creeping roots. Sesléria elongáta, 8. 1075.
Stolons, root shoots. Agróstis, g. 156. (note.)
Stomachic, relating or agreeable to the stomach. Kæmpféria, g. 12. (note.)
Strangury, a disease, and produced on plants by tight
ligatures. Ornithógalum, g. 802. (note.)
Strata, layers, beds. Cápsicum,. g. 453. (note.)
Strice, small streaks, channels, or furrows. p. 877.
Striated, having striæ. Alpínia racemósa, s. 41.
Striga, little, rigid, unequal, irregular hairs. Chára hispida, s. 15199.
Strinose, having strigæ. Lithospérmum arvénse, s. 1895.

Strophiolate, surrounded by protuberances. Hóvea, g. 1536. p. 599.

Struma, a wen or protuberance, p. 903.
Strumose, or Strumous, covered with strumæ. Mesembryánthemum gróssum, s. 7422.
Style, (250) the stalk which intervenes between the ovarium and stigma, bearing the latter. p. 1.
Styptic, having the power to staunch blood. Rhús, g. 681. (note.)

Sub, in composition, signifies subordinate, or somewhat.
Succedaneum, coming in the place of another. Tácca, g. 758. (note.)

Succulent fleshy and filled with juice. Blitum, g. 28. (note.)
Sudorific, having the power of producing perspiration. Sálvia, g. 62. (note.)
Suffruticose, shrubby in a slight degree. Spermacóce suffruticósa, s. 1656.
Sulcate, furrowed. Vibórgia, g. 1523. p. 599.
Supernatant, floating on the surface of any thing. A loe, g. 770. (note.)
Suppurate, to generate matter. Rhús, g. 681. (note.)
Supra-decompound, doubly compounded. Scirpus sylváticus, s. 863.
Surculi, young shoots. Erythrónium, g. 782. (note)
Suture, the line formed by the cohesion of two parts. Mirbélia, g. 967. p. 338.
Syngenesious, (251) belonging to the nineteenth class of the sexual system. Phlóx, g. 369. (note.)
Synthetical, combining; opposed to analytical. Gillénia, g. 1142. (note.)
Syphilitic, useful in the cure of syphilis. Chenopódium, g. 611. (note.)

\section*{T.}

Tails, (252) the long feathery or hairy terminations of certain fruits. Clématis chinénsis, s. 7968
Tap-root, a root which penetrates deep and perpendicularly into the ground without dividing. Crinum defixum, s. 4182.
Tartareous, consisting of tartar. Lecidéa cónfluens, s. 15384.

Teated, resembling the figure of the teat of animals. \(\mathrm{A}^{\prime}\) chras, g. 427. p. 111.
Tendrils, (253) the curling twining organs by which some plants lay hold of others. Vitis indica, s. 2858.

Tenesmus, a disposition to go to stool, without the power of evacuation. A'nthemis, g. 1778. (note.)
Tepid, lukewarm. A'nthemis, g. 1778. (note.)
Terebinthinate, consisting of turpentine. A'bies bal. sámea, p. 805 . (note.)
Terete, taper, round and long. Hákea obliqua, s. 1423.
Terminal, ending, or at the top. Maránta litea, s. 20 .

Ternary, consisting of threes. Valeriána, g. 78. (note.)
Ternate, (254) growing together in threes. Hedy. chium elátum, s. 31.
Tessellated, variegated by squares. Sarcocéphalus, g. 498. p. 113.

Testa, the skin or integument of the seed. Psidium, g. 1118. p. 409.

Testaceous, having a pale brown color. Mesembryánthemum testáceum, s. 7430.
Tetrachotomous, (255) a stem that ramifies in fours. Euphórbia, g. 1103. (note.)
Tetrandrous, (256) having four stamens. Collinsónia anisáta, s. 469.
Tetrapetalous, (256) having four petals. p. 1069.
Tetrasepalous, (256) having four sepals. p. 1069.
Thalamus, (258) that part of a flower which rises from below the ovarium and sometimes supports the outer envelopes. p. 539.
Thallus, (257) that part which bears the fructification of Lichens. p. 874.
Thece, the cases that contain the sporules of Cryptogamic plants. p. 874.
Threads, long delicate hairs. Anacámpseros fila. mentúsa, s. 6632.
Throat, (120) the orifice of a flower. Justicia picta, s. 285.
Thyrse, (259) a kind of dense panicle like that of the lilac. A'juga furcáta, s. 8099.
Thyrsoid, resembling a particular kind of panicle called a thyrsus. p. 85.
Tomentose, densely and closely hairy. Thýmus tomentósus, s. 8414.
Tomentum, dense close hair. Grevillea buxifúlia,
S. 1418 , bracing, corroborative. Sálvia, g. 62 (note.)

Toothed, (260) divided so as to resemble teeth. Pollíchia, g. 21. p. 1.
Toothletted, furnished with little teeth. Sálvia paniculáta, s. 402.
Topical, local, confined to some particular place. Papáver, g. 1170 . (note.)
Torose, uneven; alternately elevated and depressed. Papáver hýbridum, s 7659.
Tortuose, twisted. Heliánthemum Fumána, s. 7773.
Torulose, slightly torose. Echítes torósa, s. 2357.
Torus, (258) the same as thalamus, which see. Sisymbrium, g. 1422. p. 537.
Trapeziform, in the shape of a trapezium. Borónia serruláta, s. 5091.
Trapezoid, like a trapezium. Adiántum villósum, s. 14554.

Triandrous, (261) having three stamens. p. 80.
Trichotomous, (102) branches divided in threes. Trichódium decúmbens, s. 1000.
Tricuspidate, (262) having three points. A Ilium Pórrum, s. 4617.
Trifarious, arranged in triple rank. A'loe tortuosa, s. 4386 .

Trifid, divided in three. Mantísia, g. 16. p. 1.
Trilocular, (166) having three cells. Leptospérmum triloculáre, s. 6931.
Tripetaloid, appearing as if furnished with three petals. Tillândsia xiphioides, s. 4144.
Tripetalous, having three petals. Elatine hydropiper, s. 563.5.

Triquetrous, having three sides or angles. Aloe reticuláta, s. 4392
Triturated, reduced to powder by pounding, Amýgdalus, g. 1128. (note.)
Tropical, belonging to the torrid zone. Conocárpus, g. 544. (note.)

Truncate, (263) blunt, as if cut off. Hedýchiuin spicátum, s. 34.
Tuberculate, covered with knobs or tubercles, Ranúnculus parvifiórus, s. 8073.

Tuberous, (264) bearing solid fleshy roundish roots like the potato. Cánna edulis, s. 12.
Tubers, roots so called, Curcúma, g. 14. (note.)
Tumid, swelling. Secále orientále, s. 1267.
Tunic, a coat. Crócus pusillus. s. 606.
Tunicated, having a coat. A'llium Pórrum, s. 4617. Turbinate, (265) having the figure of a top. Salicórnia, g. 22. p. 1.

Turgid, swollen, puffed up. Brómus praténsis, s. 1132
\[
\mathbf{U}
\]

Umbellules, (153) divisions of an umbel. Calicalis daucoides, s. 3524.
Umbels, ( 154 ) the round tuft of flowers produced by the carrot, \&c. Boerhaávia scándens, s, 108
Umbilicus, (266) the cord which attaches the seed to the receptacle. Bérberis, g. 829. p. 239.
Umbonate, (267) having a top in the centre like that of the ancient shield. Cucúrbita Melopépo, s. 13566.
Unarmed, destitute of prickles or spines, which are the arms of plants. Corispermum hyssopifólium s. 124.

Uncinate, (268) hooked. Píper adfincum, s. 502.
Unctuous, fat, oily. Anchúsa, g. 333. (note.)
Undulate, waved, Sálvia pomifera, s. 370.
Undulato-rugose, rugose or rugged and waved. Stro. matosphæ'ria deústa, s. 16361 .
Unguiculated, furnished with a short unguis, Alpínia galánga, s. 40.
Unguis, (269) the taper base of a petal. Diánthus, p. 372. (note.)

Unilateral, one-sided Brachypúdium loliáceum, s. 1147.

Unilocular, (166) one-celled, Calepína, g. 1441. (note.)
Unisexual, being of one sex. Próckia, g. 1179. (note.)
Urceolate, (270) pitcher-shaped. Camphorósma, g. 254 p. 78.

Uterine, belonging to the womb. Acácia, g. 2127. (note.)
Ulerus, the womb. p. 981.
Utricle, or Utriculus, a little bottle or bladder. Salicórnia, g. 22. p. 1.
Uvula, the gland of the throat. Acácia, g. 2127. (note.)

\section*{V.}

Valvular, (271) or Valved, consisting of valves or seed cells. p. 895.
Faricose, (272) swollen here and there. Pterocárpus, g. 1515. p. 598.

Vascular, (273) consisting of tissue in a very succulent enlarged state. Potamogéton, g. 317. (note.)
Vaulted, (274) formed or placed like the roof of a vault. Gladiolus namaquénsis, s. 709.
Feneering, the art of covering one kind of wood with thin plates of another kind. Spártium scopárium, p. 611. (note.)

Ventricose, (275) inflated. Gastrídium, g. 155. p. 32.
Veratrine, the active principle of Verátrum. Verátrum, g. 2128. (note.)
Vermifuge, that which expels worms. Helléborus, g. 1237. (note.)

Vernacular, native. Zingiber, g. 10. (note.)
Vernal, belonging to the spring. Verúnica vérna, s. 254.

Versatile, (276) swinging lightly on a stalk so as to be continually changing direction. Sternbérgia, g. 742. p. 237.

Vertex, the uppermost point. Röméria, g. 1168. p. 456.

Vertical, perpendicular. Nivénia, g. 235, p. 77.
Vertically compressed, that is depressed. Salicórnia, g. 29. p. 1.

Vertilincar, the same as rectilinear; in a straight line. Viola campéstris, s. 3037.
Vesicatories, blistering plasters. Rantinculus g. 1233 (note.)

Vesicles, (277) hollow excrescences resembling bladders, g. 310. (note.)
Vexillum, (188) a standard; the upper petal of a papilionaceous flower. Petalostémum, g. 1501. p. 598.
Villous, (278) shaggy, with long loose hair. Cóstus villosissimus, s, 66.
Virescent, green, flourishing. Mesembryánthemum viréscens, s. 7275
Virgate, twiggy. Verbáscum cúpreum, s. 2152.
Viscid, or Viscous, adhesive, clammy. Boerhaávia viscúsa, s. 109.
Vivacious, lively. Cárduus, g. 1663. (note.)
Viviparous, (279) bearing young plants in the place of flowers and seed. Márica cærúlea, s. 841.
Vulnerary, useful in the cure of wounds. Symphytum, g. 334. (note.)
Vuluiform, like a cleft with projecting edges. Me.

W
Wattled, having processes like the wattles of a cock. Rhinánthus alectorolóphus, s. 8746.
Welted, flaccid, drooping. Cárduus acanthoides, s. 11375.

Whorls, (280) leaves inserted round a stem. Hippúris, g. 23. (note.)
Wing, (281) in botany, signifies a membranous bor der, wherewith many seeds are supported in the air when floating from place to place. Amomum dealbátum, s. 77.
\(Z\).
Zones, (282) stripes or belts. Zonária pavónia, s. 15338. O signifies wanting or absent. p. 79
\(\bigcirc\) O, very numerous.

\title{
TABLE OF SUCH
}

\section*{AS HAVE SYNONYMES IN}

In this Index, the systematic names in col. 1. are distinguished as classical, i. e. names memorstive, by the terminating letter or letters being in Italic, as Bánksia; and as the other names are formed, in almost every case, from the Greek, but sometimes from

\section*{OF THE GENERA,}

\section*{DIFFERENT LANGUAGES.}
applied to plants by the anclents, by the first letter being In Italic, as \(A\) 'bies; as com. aboriginal, or of uncertain derivation, by the whole word being in Italic, as A'rua. All the Greek and Latin.

THE ENCYCLOPADIA OF PLANTS; \\ BRINGING DOWN THE WORK TO MARCH, 1839.
}

\author{
Prepared by William H. Baxter, under the Direction of J. C. Loudon, and finally revised by George Don, F.L.S.
}
N.B. A + prefixed to genera or species indicates that such genera or species have been already registered, but are here repeated with more perfect details.

\author{
Page 8. Class II. - DIANDRIA. 2 Stamens.
}

Order I. MONOGYNIA. 2 Stamens. I Style.
2500. 47 a. Belopérone. Calyx 5-parted. Upper lip of corolla concave, lower one trifid. Stigma subulate. Capsule compressed from the base to the middle and empty; but swollen, and containing 4 seeds at top.
\(250164 a\). Streptocárpus. Cal. 5-cleft. Cor, tubularly funnel-shaped; Limb 5 -lobed, nearly equal, oolique. Stam. 4: 2 front ones fertile; the other 2 tubercle-formed and sterile. Valves of capsule twisted. Stigma 2-lobed. seed minute, naked.

\section*{Page 30. Class III. - TRIANDRIA. 3 Stamens.}

\section*{Order I. MONOGYNIA. 3 Stamens. 1 Style.}
2502. 80a. BEtckia. Cal. 1-toothed, deciduous. Cor, funnel-shaped, 5-lobed. Caps. 1-celled, 1-seeded.
2503. 94a. Streptanthèra. Perianth 6-parted; tube very short. Anthers twisted yound each other. Ovar. 6augled, also a little twisted. Ovula kidney-shaped.
2504. 107a. Anisinthus. Spathe 2-valved, subringent. Perianth unilabiate; limb equal, 6-parted; upper segment long, cochleariform. Stigmas 3, dilated, entíre. Capsule triangular, 3 -valved. Seeds cumulated, winged.
2505. 114a. Dietes. Flower 6-parted, equal, spreading. Stigmas petal-like, bifid.
2506. 114b. Leucocoryne. Perianth salver-shaped, 6-parted, 3 fertile combined, and the 3 sterile on the limb, fleshy, and sometimes antheriferous. Style terete. Stigma simple.
2507. 114c. Triteleìa. Perianth funnel-shaped, 6-cleft. Stamens 6 ; upper ones opposite the petals. Stigma 3-lobed. Ovarium many-seeded.
2508. 117 a. Sisyrinchizem. Spathe 2-lvd. Calyx 0. Petals 6. Filaments connate. Style 1. Caps. 3-celled, inferior.
2509. 117b. Reneálmia. Perianth 6-parted. Filaments connate or distinct. Stigmas 3, involute, filiform, acute. Capsule obovate. Seeds angular.

Page 76. Class IV. - TETRANDRIA. 4 Stamens.

\section*{Order 1. MONOGYNIA. \& Stamens, 1 Style.}
2510. 237a. Conospérmum. Cal. ringent ; Upper lip 2-lobed. Nut pappose, inversely cone-shaped.
2511. 237b. Botryceras. Cal. 4-parted. Cor. 4-petaled. Style arcuate. Nut subulate.
2512. 238a. Anadenia. Calyx nearly regular. Gland 0 . Follicle 1 -seeded.
2513. 238b. Agúslachys. Calyx regular. Filaments distinct. Stigma lateral. Ovary 1-seeded.
2514. 295a. lipóstoma. Limb of cal. 4-parted. Cor, tubular at base, and ventricose at throat, bearded inside. Stam. inserted in throat. Style capillary. Stigm. 2, subulate, hispid. Caps. globose, 2 -celled, opercul, many-seeded, often 1 -celled. Seeds small, angular, scabrous.
2515. 3c6a. Benthamia. Flowers disposed in heads. Invol. of 4 petal.like parts. Cal. 4-toothed. Petals 4, flesher Fruit constituted of many pomes grown together. Endocaro 2 -celled. Seeds solit. and pendul. in each cell.

istory, Use, Fropagation, Culturc,
51. Calccolaria. The varieties and hybrids of this genus, which have been raised in different parts of the country, are almost innumerable, and some of them are of very great beauty. They are all of the easiest culture, and require very little heat. Most of them continue flowering several weeks, and some of them the greater part of the summer.

16733 Bran. swoll. at joints, Lvs ovate.-acum, obsc. serr. Flws, in short axil. 2-3-flwd. racem. erect, Bract. 4 -5 base each fl. lin.-fil.
[Brac. and cal. segms. subul. short. th. cor
16734 Stem joints short tumid in middle, Lvs. obl.-lan. very acumin. wavy minutely downy, Panic. termin. crowded, 16735 Lys. on long pet. ovate-atten. at base sharply acumin. retic. Bract. numer. outer ovate-lanceo. inner lin. Cor. very long, Up lip erect ent. low. revol. 3-toothed.
16736 Lvs, obl. attea. both extrems. acute subcrenul. Racemes term. Flws. fascic. Cal. \& brac. lin, thd., Cor. sptd. 16737 Lvs. ovate acumin. credat. Panic. large termin. Flws. remotely fascicul, subsess. disposed in slender elongated racemes

16738 Spikes axill. Brac, bracteol. and leaves lanceolate, Anthers calcarate at base
16739 Lvs. subsess. obl.-lan. acumin. very entire, Brac. small, Cal. segms. obt. Tube bent, Spike termin. subsimp,

16740 Livs. larger \& broader than those of C. integrifdlia. The whole plant clothed with viscid pubescence
16741 Leaves lanceolate-acumin. canescent beneath, Corymbs panicled, Pedicels elongated
16742 Leaves ovate petiolate denticulate pubesc. lower ones acute at base, Corymbs umbellate few-flowered
16743 A hybrid between C, corymbòsa and C, arachnöidea, with ochraceous and dirty-purple flowers
[ovate bluntish
16744 Lvs. obl.-ovate bluntish much veined \& rugose, hispidly hairy, Stem erect, very hairy, Segm. of cal. broadly 16745 L.vs, rather obtuse atten, at base velvety above beneath clothed with long hairs and small scale-lk. brist. serr. Cal. peltate deeply 4-cleft
16746 Stem lvs, cordate decuss. upper ones smaller entire with few long scat. hairs on their surfaces, Calyx downy
[bellate
16747 Lvs. linear atten. at both ends lined distinct. serr. Teeth reflexed, 2 -in. Iong 2 lines broad, Pedun. comp. um16748 Whole plant clothed with white wool, Livs. ovate or oblong, Flws. corymbose, Calyxes 3-nerved
16749 Lvs, ovate acute waved nerved, Lower ones atten. at base and connate, Upper ones nearly cord. sessile, Pan. spreading
16750 Herb clothed with white cobwebbed-wool, Lvs. Iigulately-oblong little toothed petioles 5 -in. long, Peduncles terminal twin
16751. Stemless, Lvs, radical ovate rhomboid rosulate serrated nerved, Scapes generally 2-3-fiwd. pilose 16752 Leaves ovate biserrated, Branches dependent bluntly tetragonal of a rusty purple colour
16753 Lvs. ovate-lanceol. sharply serr. pubesc. Pedun. collected into term. panic. generally 4 -flwd. shorter than Ivs.
16754 Stem pilose, Lower lvs, ovate-oblong obtuse petiolate, Upper ones sessile, Lower lip of cor. very large
[sess. Infl. cymose many-fld.
16755 Stem cal. \& bract. beset with glandul. hairs, Stem lvs. oblong-lanceol. undul. thd.: upper ones ent. ov. acum. 16756 Radical lvs. many: stem lvs. few : 2 lower ones subpet. : upper ones sess. Pedic. racem, 1-fiwd. Caps papery.
[fulvous
16757 Rad. Ivs. obov, rather spathul. obtuse uneq. thd. Stem Ivs. ov. pointed alm. ent. Corymbs forked 10 - 30 -fid. Ped. 16758 Radical lvs. ovate somewhat obtuse, Corymbs few-flowered
[filif. clthd. gland. pubes.
[revol. obsol. 3-thd.
16759 Lvs. ovate-acumin. rounded at base : lower ones serr. : upper quite ent. Lower lip much wider than upper 16760 Lrs. obl.-lanceol. narrowed at base sharply \& remotely toothed, Bract. ciliated often purplish or ye!lowish

16761 Lrs. ovate-cord. \(2-3\)-in long glabrous obtuse rather wavy, Flws. erect oppos. subsecund, Bract, ovate acute 16762 Lvs. cord. ovate acumin. toothed, Whorls 6-flwd. Bract. decid. very large broadly ovate, nerved red
16763 Lvs. oval obtuse rounded or cuneated at base irreg. crenated in middle nearly glabrous, Whorls 2-flwd. Cal.
16764 LVS. cord.-ovate crenated hoary bentath, Bract. decid. Galea villose
[usually cld.
16765 An undescribed species, introduced by Lagasca.
16766 Racemes branched, Flowers fewer \& smaller than those of S. phlomöldes
16767 Lvs, ovate acum. crenate-sinuate: upperm. ent. Fls. in dist. about 6 -flwd. whorls each wh. supported by 2 ov.acum. awned concave streaked bracts
16768 Lvs. petiol. broadly ov. acute subcord. at base, Rac. loose verticill. few-flwd. Upper lip of cor. entire toothed : Lower acute
16769 The only species

and Miscellaneous Particulars.
2501. Strcptocárpus. This plant is very readily increased by seed, or by division of the root, and thrives best in a light rich soil. It is a very ornamental stove herbaceous plant, and well deserving of caltivation.

105. Gladiolus. Some valuable additions have been lately made to this beautiful genus, of which the most splendid is unquestionably \(G\). natalénsis, which is also very hardy, and of as easy propagation and culture as the \(G\). communis.

16790 Lvs, 3-nerved, Scape few-flwd. Segments of cor, ringent even somewhat transparent
16791 Lvs. very narrow, Scape 2-flwd, Tube equal to the spathe, Segments lanceolate obtuse
16792 Lvs. linear ensif. ribbed slightly glaucous, Tube scarcely equal to the spathe
[hollow
16793 Lvs. narrowly linear elong. straight rigid promin. 2-nerved, Lower segm. of fl. obovately ovate spoon-shaped
16794 Lvs. broadly ensif. acumin. ribbed, Spike distich. about 10 -fiwd. Tube shorter than outer spathe, Segm. ovateoblong recurved and wavy
16795 Leaves ensif, bicostate obscured nerved, Spikes term. 10-12.fwd. Sheath dbl. convolute, Tube \(\frac{1}{2}\) length of ft. campan. spreading
16796 Lvs. 8.9 green nerved acute twisted

16797 Nearly allied to A. juncea, but differs in having longer tube to flower, greater irregularity of limb and form of spots at base of 3 anterior segments
16798 Scape simple erect, Lvs. ensif. linear acute smooth nerved, Flowers distichous

16799 Lvs, equal lincar ensif. Scape round branch at top
16800 Lvs, distichous ensif. spirally twisted, Scape branched compressed leafy many-fiowered

16801 Lvs. linear glaucous, Limb laciniate lanceolate, Stamens sterile subulate obtuse

16802 Lvs, ovate-lanceolate, Limb linear-lanceolate
16803 Lvs. linear glaucous, Scape longer, Involucrum with pedicels twice as snort, Umbel many.flwd.
16804 Lvs. linear, Involucrum sheathed: at top bifid, Peduncle filiform shorter
16805 Crested, Scape 2-flowered, Leaves falcate shorter, Spathe 2-leaved
[12 furrows and 12 obtuse angles
16806 Scape nearly round ltl. flatt. twist. about 3 -flwd. Spathe 3-bracts; outer nearly l ft. long very narr. atten. Germ. 16807 Sheath radical long surrounding the leaves, Lvs, very long thick quadrangular striated very glaucous
16808 Lvs. in tufts rigid erect linear-ensif. tough, Stem angul. leafy, Ovar. on long stalks not enclosed in flor, leaves somewh. 3-cornered, Stigm. 2-lbd. short
16809 Stem 3-4-flwd. Lvs. linear-ensif. striat. acumin. slightly falcate, Peduncle shorter than foliaceous spathe
[mucron. Caps. pear.sh. pubes. 16810 Lvs. linear-ensif. striat. Peduncs. \(4-5 \mathrm{in}\). long, Pedic. \(1 \frac{1}{3} \mathrm{in}\). long also very slender, Pet. 6 oblong-spathul, retuse 16811 Foliage minutely hairy, Scape erect longer than lvs. somet. divided bearing mostly 3 fascicles of flws. Flws. with little heart-sh. spot at base
16812 Pedun. solit. or 2-4, Spathe diphyl. Bract. scariose convolute, Col. of fil. long densely covered with longish gland. yellow hairs
[sever. very frag. nodding 16813 Lvs. very narrow glauc. subul. at apex, Spath. consist. of bract. membran. at margin lowerm. sharpest, Flws. 16814 Stem remarkably compressed, Spathe lanceol, condupl. green with broad white membr. margin. Germ. glandlr. 16815 Bulb ovate, Lvs. mostly radic. dply. striat. sheathing, Spathe 2 unequal lvs. about 2 -flwd. Pedun. 1 -in. long curved, Ov, oblong glabrous
16816 Stem terete simple, Lvs. lanceol, veined, Spathe gener. 3-flwd. Segm. of cor. spathulate, Root bulbous

16817 Lvs. oval-oblong pointed smooth on both sides, Flowers in long racemes

and Miscellanevus Particulars.
16815. Sisyrinchium spcciosum is a lovely species, found about Valparaiso, on sandy hills; to be brought to perfection, it requires to be planted in dry light soil, and placed in a warm sunny situation in the green-houst.

2544. 509a. Colletia. Calyx campanulate, coloured. Petals 0. Anth. 1-2-celled, reniform or ovate. Disk cup-sh.

Style simple, clongated. Fruit dehiscent, containing 3 nuts.
2545. 5096 . Ketanilla. Calyx urceolate, 5 -cleft.. Petals cucullate, sessile. Stam. enclosed. Anth. reniform, 1celled. Disk covering bottom of calyx. Style simple. Fruit containing a 3 -celled nut.
2546. 509c. Trevda. Cal. turbinate, 5-cleft. Petals cucullate. Stamens enclosed. Anthers 1-celled, reniform. Disk almost wanting. Style iong, hairy. Caps. membranous, 2 -valved, 1 -seeded.
2547. 518a. Colconerma. Cal. 5-parted. Disk adnate to base of cal. with 5-lobed margin. Petals 5, with spreading border. Anth. terminated by minute sessile gland. Caps. of 5 horned carpels.
2548. 529a. Escallonia. Tube of the calyx semiglobose, adnate to ovarium ; limb 5-toothed or 5-lobed. Petals 5, arising from calyx. Stam. 5. Anthers ovate-oblong. Stigma peltate. Style filiform, permanent. Caps. baccate. Seeds numerous.

25\%9. \(540 \alpha\). Erpètion. In every respect the same as \(V\) iola, but the sepals are hardly drawn out at base, and the lower petal is not drawn out into a spur; but furnished with a smail gibbosity. Anth. without appendages.
2550. 241a. Hymenunthèra. Sepals imbricate. Petals at length reflexed. Structure of stams. as in \(V\) lola, but joined at base into monadelphous disk, with a scale at back of each. Caps. rather baccate, 2 -celled; cells 1 -seeded.
2551. 565a. Oplothèca. Cal. semi-5-fid, bibracteate. Cor. 0. Nectar. tubular. 5 -toothed. Anth. 5, sessile at mouth of tube of nectarium, and alternate with its teeth. Utriculus l-seeded. Style undivided. Stigma capitate.

\section*{Order 2. DIGYN1A. 5 Stamens. 2 Styles.}
2552. 578a. Harrisonia. Cor, urceolate, 5 -toothed, throat naked. Crown of stam. of 5 pieces, each with a fleshy process or tooth.
2553. 5786 . Tweedia. Calyx 5 -parted. Corolla campanulate. Corona simple of 5 retuse exserted pieces opposite the petals. Pollen masses ventricose. Stigma acuminated bipartite. Gynostegium none.
2554. 579a. Philibértia. Corona double; outer one annular, entire, fleshy, undulated; inner one inserted on the top of the gynostegium of 5 entire fleshy segments. Cor. urceolate, sinuately 5 . lobed, furnished with smali teeth between the segments.
2555 590a. Physidanthus. Cor. tubular. Tube inflato-ventricose; limb 5-fid, connivent.
2556. 592a. Tyluphora. Corona simple, 5-lvd.; leaflets depressed, fleshy, toothless inside, pressed to the gynoste. gium. Pollen masses transverse or ascerding. Cor rotate.

Order 3. TRIGYNIA. 5 Stamens, 3 Styles.
2557. 684a. Stachhođsia. Calyx 5-parted. Petals 5, joined by the claws. Stamens unequal, alternating with the petals. Stigma acute, simple. Capsule tricoccous.

History, Usc, Proparation, Cuilure,
2522. Gilia. Elegant hardy annuals of the easiest culture, the seeds requiring only to be sown in the open bordcr in spring The larger the quantity of each grown together, the more showy their appearance.
2523. Egóchlua. A genus of singular, but by no means showy, plants, requiring the same treatment as those of Gilia.
2524. Lind́nthus. Culture, propagation, \&c, the same as those of Gilia.

16916 Lvs. pinnatif. lobes few broad little-toothed, Cor. scarcely longer than calyx, Placentas 2-ovulate
\(\dagger 2294\) Nearly related to N. parvifiora, but differs in flws. being twice the size \& calycine append. being larger \& longer 16917 Petioles auriculately dilat. at base, Cor. twice as long as cal. Lvs. while oppos. connate at base
16918 Lvs. 3-4-lbd. on each side entire or cut, Petiol. without append. Cor. twice as long as cal. Placent. 10-12-ovul. 16919 Lvs. oppos. pinnatif. lobes \(5-9\) alm. ent. Cor. rotate very pilose bottom \& obov. segms. Placent. about 10 -oyul. Seed strophiolate smooth

16920 Corolla 3 times longer than the calyx
16921 Corolla twice longer than cal. Flws, one half smaller than those of G. liniliora
16922 Corolla hardly exceeding the calyx, Habit of Arenària tenuifùlia
[or ovate flat
\(\dagger 2300\) Lps. pectin,-pinn. Leaf. linear acumin. Tube of cor. 5 times longer than cal. Limb spread. Segms, acute obl.
[acumin. channelled] 16923 Lvs, pectin.-pinn, clthd. cobwebbed villi as are bract., Leaf. or segms. lin. mucron. Segms, of limb ov.-lanc.
16924 Lvs. glabr, bipinn. Flws. usually solit. Corymbs loose on long pedunc. Cor. 4 times longer than calyx 16925 Lvs. pinnatif. Lobes ovate, Flws, somewhat glomer, Cor. 3 times longer than the cal.
16926 Lvs. pinnatif. rather woolly at length glabr. Segm, oblong lanc. ent. or cut, Flws. nearly solit. divaric. panic. Cor. twice long. than cal.
\(\dagger 2301\) Lvs. pinnatif. lower ones bipinnate, Segms. linear, Flws. solit. term. panic. Cor. about twice length of calyx
16927 Lvs. bipinnate, Leaf. or segms. limear subul. Corymbs 3-6-flwd. virgately panic. Corolla about 3 times longer than calyx.
[Cal. segms. subul.
16928 Lvs. pinnatif. Segms. narrow obl. sinuat., Pedun. axill. solit. 1-3-flwd. Cor. tubular hardly long. than cal 16929 Lvs. somewh. bipinnate smoothish, Segms. linear, Corymbs 3-10-flwd. Pedun. very long, Cor. hardly twice longer than cal. [than cor. 16930 Lvs. 2 or 3 -pinn. Segms, or leaf. linear subul. Cal. rather woolly, Cor. twice longer than cal. Stam. shorter 16931 Lvs. bipinnatif. Segms. linear cut, Flws. sess. dispersed in dense heads, Cor, longer than cal. Stam. shorter than cor.

16932 Lvs, pinnate, Leafl. ent, or cut lobes lanc. lin, very acute spinose, Cal. segms. lanceol. FJws, glomerate termin.

16933 Lvs. opposite sessile palmate, with 3 to 5 linear-subulate segments
16934 Lvs, numerous nearly all pinnatif. glabr. Tube of cor. longer than cal. Stam. about equal in length to cor. 16935 Lvs. short simple or furnished with 1-2-segm. on each side tomen. Tube of cor, exserted, Stam. exceeding cor. 16936 Lvs. elongated simple or pinnatif. clothed with loose white wool, Tube of cor. longer than cal. Stam shorter than cor.
16937 Lvs. lower elongated simple glabr. upper short pinnatif. woolly, Tube of cor. shorter than cal. Stam equal to cor.
16938 Lvs, 7 -11-cleft, Segms. subul. straight margins revolute, Tube of cor. hardly twice longer than limb, Filam. very short
16939 Lvs. 5 - 7 -cleft, Segms. oblong-linear, Tube of cor. 2 or 3 times longer than limb, Stam. 3 times shorter than limb of cor.
16940 Lvs. ditto, Tube of cor. about 4 times longer than limb, Style scarcely equal to corolla
16941 Lvs. ditto, Tube of cor. 4 times longer than limb, Stams. hardly \(\frac{1}{3}\) shorter than limb of cor. Style little exserted 16942 Lvs. 9-11-cleft, Segms. subul. erect margins revolute, Tube of corolla shorter than limb

16943 Herb nearly simple glabr. or downy, Lvs. oppos. lin. ent. Flws. 1-3 together pedunculate, Cor. nearly 1 in . long

and Miscellaneous Particulars.
2525. Hugetia. Culture, propagation, \&c., the same as those of Gilia.
2526. Leptosiphon. All the species of this genus are very pretty showy plants, and are well worth cultivating in every garden. Culture, \&c., of Gilia.

2527 . Fénzlia. Culture and propagation the same as those of Leptosiphon.

History, Use, Propagation, Culture,
2535. Wahlenhérgia. The seeds of the annual sp. of this genus require to be raised on a hot-bed; and, when sufficiently strong, planted into the open border, in a sheltered situation. The perennial sp. grow freely in loam, peat, and sand, and strike root readily under a hand-glass.
2536. Pratia. Plants of this genus are readily increased by division of the root, or by seea; and thrive best in a mixture of loam, peat, and sand.
2537. Tupa. The species of this genus are deserving cultivation in every collection, on account of the beauty and singularity of their fowers. They are generally raised from imported seeds; and, when the plants are sufliciently strong, may be planted in the border under a south wall, but require to bn potted in the autumn, and placed in the green-house during winter. \(T\). Feuillei yields a dangerous poison in Chile.

16975 Lvs, ovate-lanc. short-acumin. scabrous on both surfaces rounded at base, Cal. segms. linear villous

\section*{17002 The only species}

and Miscellancous Particulars.
2538. Siphocampylos. The sp. of this genus have all large, showy, scarlet, or red flowers, and well deserve a place in every stove. They are of easy culture. A mixture of loam, sand, and peat soil suits them best; in which cuttings strike readily under a hand-glass in heat.
2539. Lechenaúltia. Elegant plants when in blossom. A mixture of turfy loam, peat, and sand suits them best: and cuttings of the young wood root freely in the sam \({ }^{\circ}\) kind of soil under a hand-glass.
2540. Brundnia. Culture and propagation as for Scæ'vola in p. 169.

2541, Leycestèria. This is a beautiiul shrul when in a flowering state, from the contrast between the deep green hue of its stem and ivs, and the reddish purple of its large bracteas and berries. It is easily propagated by cuttings, or by seeds, which it produces in abundance.

History, Use, Propagation, Culture,
2581. Camássia 17162 esculénta. "This plant is known by the natives under the name of Quamash; and the bulbs are carefully collected by them, and baked between hot stones, when they assume the appearance of baked pears, and are of an agreeable sweet taste. They form a great part of their winter stores. Though an agreeable food to Governor Lewis's party, they occasioned bowel complaints if eaten in any quantity. It is perfectly hardy, requiring to be planted in a peat border, and may be propagated either by seeds or bulbs. (Pursh.)
2585. Herrèria. A singular, but desirable, hot-nouse climber, growing freely in any good soil.
2587. Mahdnia. "The species are elegant evergreen shrubs, with yellow flowers and pinnate leaves. The latter

875. Tropǎolum 17199 tuberosum. This species may be considered about as hardy as the potato, and, like it, produces eatable and agreeably flavoured tubers, \(\mathbf{M r}\). Lambert was the first, we believe, who grew these tubers in England, and presented them at table. When boiled, the tubers are of a soft pulpy substance, and, Mr. Cameron says, in havour resemble sea-kale, mixed with the hot taste of garden cress. The council of the Caledon. Hort. Soc. considers the tubers to be of a very delicate flavour, resembling the richest aspararus. Mr. Young of Epsom found the

2508. Eucharidium. A pretty and very neat little plant, sceds of which may be sown at any period of the spring or summer, as they will generally flower in about six weeks after sowing.
2599. Francò. A genus of ornamental perennials, which are, however, found to be most useful if treated as halfhardy annuals, because, as perennials, they are too tender to endure the winter in the open air without protection,
Berides this, they can only be propagated by sceds.

\section*{Order 1. MONOGYNIA. 10 Stamens. 1 Style.}
2601. Castanospérmum. Calyx somewhat bilabiate, with short tube; upper lip bifid, sower one 3-fid. Petals 5 , papilionaceous, with wings and keel nearly equal in length. Legume stipitate, large, oblong-cylindrical, 2-valved, usually 4-seeded. Valves coriaceous, spongy inside.
2602. Rcichárdia. Sepals 5, joined into campanulate crenulated calyx. Petals 6-10, somewhat papilionaceous. Stam. declinate, distinct, cohering together beneath middle by beard. Style filiform. Stigma dilated. Legume samaroid, ending in oblong wing.
2603. Eriostèmon. Calyx 5-parted. Petals 5, marcescent. Stamens unequal, free, fringed, tapering into a thread which bears the anthers. Fruit of 5, rarely l-2, carpels.
2604. Phibdlium. Calyx 5-cleft. Petals 5. Stamens unequal, smooth. Style and stigma 5.furrowed. Fruit of 5 capsular, 2-valved, 1 -seeded carpels, girded by calyx.
2605. Pieris. Calyx 5-parted. Corolla tubular or ovate, with a contracted, 5-toothed, revolute mouth. Filaments dilated, furnished with two bristles at the tip. Anthers with short incumbent cells that open lengthwise. Style 5 -cornered. Stigma truncate. Leaves coriaceous. Flowers drooping, terminal, racemose.
2506. Pernétya. Corolla globose, with a revolute limb. Anthers with the 2-cells 2-lobed at the tip; the lobes bific. Hypogynous scales 10,3 -lobed, surrounding the ovary. Berry with 5 cells, the dehiscence loculicidal.
2607. Limnúnthes. Calyx 5-parted. Petals 5. Stamens 10. Nuculæ 5.
2608. Cheetogástra. Calyx turbinate, pilose or scaly, 5-lobed. Petals 5. Filam. 10, glabrous. Anthers oblong, having connectives drawn out into simple or bifid spur, and sometimes only into 2 blunt tubercles. Ovarium bristly at ariex. Capsules 5-celled.
2609. Ceratopétalum. Limb of calyx 5-parted, permanent. Petals 5, linearly multifid, permanent or wanting. Anthers beaked. Capsule 1 -seeded from abortion, dehiscing at apex. Leaves simple or ternate.
2610. Darwinia. Tube of calyx drawn out into membranous deciduous limb, throat dilated. Lobes roundish, cordate. Stamens free. Ovarium l-celled, l-ovulate.

\section*{Class IX. - ENNEANDRIA.}

\section*{MONOGYNIA.}

\section*{Order 2. DIGYNIA. 10 Stamens. 2 Styles.}
2611. Pachynèma. Stamens 7 or 10 , free. Filaments broad and thick at base. Ovaries 2. Styles awl-shaped. Sepals and petals 5 , but the petals soon fall off.
2612. Addmia Limb of calyx with 5 short teeth. Petals 5 . Styles ending in rather club-sh. 2-lobed stigmas. Berry crowned by teeth of calyx, somewat 5 -celled, many-seeded.
2613. Tillima. Free part of calyx inflated, 5 -toothed, the adhering part conical. Petals 5, jagged. Styles \(2-3\), distinct. Capsule 1-celled, 2-valved at apex.

Order 3. TRIGYNIA, 10 Stamens. 3 Styles.
2614. Stigmaphýllum. Calyx 5-parted. 4 of the segments biglandular at the base. Petals unequal. Stamens unequal. Styles floriaceous at apex. Samar. usually 3, one-seeded, winged at end.
2615. Thryállis. Petals roundish, unguiculate. Stamens awl-shaped. Caps. triquetrous, separable into 3 parts ; cells opening by outer angles.
2616. Galphimia. Calyx glandess. Petals unguiculate. Stamens nearly free. Drupe containing 3 1-seeded nuts, which open on the back.
2617. Dè̀txia. Calyx 5wcleft. Petals 5. Filaments fiattened, tridentate at apex, middle tooth bearing the anther, Capsule 3-4-celled.
\[
\text { Order 5. PENTAGYNIA. } 10 \text { Stamens. } 5 \text { Styles. }
\]
2618. Echevèria. Cal. 5-parted. Sepals erect, referable to leaves, united at very base, erect, thick, stiffish, thickest at middle nerve, and nearly 3 -gonal at base, acute. Stamens shorter than petals, adnate to them at base. Carpels 5 , ending each in subulate style.
2619. Balhásia. Calyx 5-leaved, involucrated by 10 lineal bracteas. Petals spreading, obtuse. Stigma 5-lobed, sessile. Capsule 5-lobed, many-seeded. Seeds compressed
2620. Visciria. Calyx cylindrical, 5-toothed, naked. Petals 5 , unguiculate, scales in the throat. Capsule 5-celled.

\section*{MONOGYNIA.}

History, Use, Propagation, Culture,
2601. Castanospermum. The seeds are eaten by the natives about Moreton Bay on all occasions, and, when roasted, have somewhat the flavour of Spanish chestnuts; and even Europeans, who have subsisted on them for two or three days together, have found no bad effects from them when roasted. For culture and propagation, see Ceratonia.
977. Poinciàna 17232 règia is a magnificent tree, no less remarkable for its extreme beauty than for its rarity, having been found only in Madagascar, near Foul Point, where it is known by the name of Tanahou.
17281 Gilliesii. The flowers of this species have a disagreeable smell, and are considered by the common people of Chile to be injurious to the sight; hence the vernacular name mal de ozos. The shrub will not grow unless in irrigated places. (Don's Mill. v. 2. p. 433.)
2602. Reichárdia. Culture and propagation the same as for Poincìina.
2603. Eriostemon. A genus of beautiful shrubs with pink flowers, which deserve a place in every collection of green-house shrubs. They require the same treatment as Phebalium.
2604. Phebalium. An equal mixture of loam and peat suits this genus of plants, but care must be taken not to overwater them, or crowd them amongst other plants. Cuttings root freely in sand under a bell-glass, without heat.
1014. Rhododéndron. "Under this genus, Professor D. Don has included the Azàlea, which, however technically correct, appears to us injudicious in a practical point of view; and though we have followed his arrangement in this article, yet we have indicated two sections, containing the Indian or tender, and the Asiatic and American, or hardy, azaleas, which those who cultivate extensive collections of these shrubs may, if they choose, consider as constituting the genus Azàlea as heretofore. Such persons, therefore, may view the genus Azalea as remaining exactly as it is in

and Miscellaneous Particulars.
our Hortus Britannicus." (Arb. Brit. vol. ii. p. 1130.) "Of all the genera in existence," G. Don observes, "Rhododéndron" (under which he includes the Azàlea) "comprises the most handsome, elegant, and showy shrubs for adorning shrubberies or planting singly on lawns." Though in Britain these plants are solely cultivated as ornamental, yet, in their native countries, they are not without their other uses. "The Rhodoreæ," Mr. Royle observes, abound in stimulant, and even deleterious, properties. Thus \(R\) hododéndron pónticum, \(R\). máximum, \(R\). ferrugineum, and \(R\). chrysänthum, are poisonous to cattle which feed on them ; and yet, in moderate doses, are used in medicine, for the cure of rheumatism, \&c. Azalea procumbens \(L\). and \(L\) èdum palústre are accounted diuretic ; and \(L\). latifolium, being more stimulant, is used as a tea, under the name of Labrador tea, but determines to the head. Kálmia latifolia is accounted poisonous, and honey collected by bees irom its flowers is of a deleterious nature, as is that of Azàlea pontica, which was so injurious to the soldiers in the retreat of the Ten Thousand. In the Himalayan species, \(R\). arboreum is more remarkable for its use as a timber tree than the other species. The flowers are eaten by the hill people, and formed into a jelly by European visiters. The leaves of \(R\). campanulatum, being used as a snuff by the natives of India, are ímported from Cashmere, under the names of hoolas-kasmeeree (Cashmere snuff) and burg-itibbut (Thibet leaf), though easily procurable within the British territories. It is remarkable that De Candolle mentions the employment in the United States, for a similar purpose, of the brown dust which adheres to the petioles of kalmias and rhododendrons. The leaves of \(R\). lepidotum (a species not yet introduced into Europe) are highly fragrant, and of a stimulant nature." (Royle Ill. 219.) Culture, propagation, and other particulars, see p. 144. and p. 358, 350.

History, Use, Propagation, Cullure,
2608. Chatognstra. The species require a mixture of loam peat, and sand; and young cuttings root readily in heat, under a band-glass.
2609. Ceratopétalum. A mixture of peat and loam suits this plant, and ripened cuttings roct readily in sand, under a hand-glass.
2610. Darwinia. Singular plants, requiring to be grown in a mixture of loam, peat, and sand; and young cuttings root readily in sand, under a hand-g!ass.
2611. Pachynema. This shrub thrives well in a mixture of loam and peat, and cuttings root freely in sand, under a hand-glass.
2612. Addmia. This shrub requires a mixture of loam, peat, and sand, and cuttings root readily in the same kind of soil, under a hand-glass. It is called bansook by the natives.
[nrvd. villous both surfs. Pedur trichot.
17300 Stem somewh. 4-gonal clothed with adpressed villi, Lvs, petiol. broad lanceol. acumin. serrulately ciliated 5 17301 Erect nearly simple, Stem 4 -gonally terete villous, Livs. almost sess. lanceol.-lin. acute quite ent. 3-5-nrvd. villous, Pedic. axill. 1-fiwd.
17302 Leaves ternate. Flowers with petals
17303 Leaves acerose, Receptacle chaffy, Style 3 times length of flowers, Calyx red

\section*{DIGYNIA.}

17304 A little leafless shrub with the habit of \(E^{\prime}\) phedra. The only species
17305 The only species
17306 Lvs. cordate lobed dentately serrated, Racemes elongated, Petals oblong-linear pinnatifidly jagged
17307 Lvs. ovate acute serrat. pilose, Racemes termin. tomentose rather compound at the base, Flws. usually trigynous 17308 Stem erect dichotom, branched, Lvs. obovate spatulate nrly. smth. ciliat. on margins, Flws. axill. solitary

17309 Flws. aggreg. sess. Cal. scales broad mucronate with membranaceous margins longer than tube, Lvs. lanceol. many-nerved
[lin. very long conuate at base
17310 Flws. numerous sess. in hemispherical heads leafy bracts at base, Cal. scales ov. acumin, preassed to cal. Lvs. 17311 Stem erect, Flws. rather aggregate, Calycine scales 6 acuminated divaricating shorter than tube, Petals multifid bearded, Lvs. lanceol.

\section*{TRIGYNIA.}

17312 Lvs. glabr. sagittately hastate angular acute, Hind lobes truncate margined horned, Petiole biglandular at apex 17313 Lvs, ovate lanceol. glauc. green above white ben. Racemes short panicled, Petioles biglandul. at apex

17314 Lvs. ovate obtuse smooth glaucous beneath 1 tooth on each side at base, Petioles without glands

17315 Lvs. ovate acute sharply serrated pilose, Rac. terminal tomentose, Flowers usually trigynous

\section*{PENTAGYNIA.}

17316 Lvs. orbicularly cuneated, Petiole thick, Flws. in spicate panicles
17317 Lvs. flat cuneiform acutely mucron. crowded at tops of branches, Pedic. spreadg. Flws. on short pedic. along bran. of panicle
[compound, Petals lanceol. acute little long. th. stams 17318 Lvs. oppos. obsoletely denticul. adnate: inferior ones broadly ellipt. superior sess. cord. Corymbs termin. 17319 Lvs. opposite orbiculate denticulate 17320 Stem flat on ground at base ascending, Lvs. obl. altern. obt. loosened at base, Cymes bifid glabrous, Fetals 7

17321 Stem erect leafy, Pedun. umbelliferous 5-6-fiwd. longer than lvs. Leaflets obovate, Petals crenated 17322 Stem erect branched, Pedun. long, Flws. subumbellate drooping before expansion, Leaflets 3 obcordate sessile

2614. Stigmaphyllum. A handsome climber, propagated by cuttings.
2615. Thrycillis. A mixture of loam and peat will suit this plant, and ripened cuttings will root in sand under a hand-glass, in heat.
2616. Galphimia. A geuus of rather handsome shrubs, requiring the same treatment as Thryállis.
pagated by cuttia, A very showy free-flcwering shrub, which deserves a place in every collection. It is readily pro-
pagated by cuttings or layers. According to Kæmpfer, the wood is used by the cabinetmakers in Japan for making
their very finest pegs, for which its hardness and toughness render it well adapted.
2618. Echeveria. Culture, propagation, \&c., see Crássula, in p. 230.

10ne 2 in.
long and 1 in . in diameter. When raw, they are slightly subacid, but on being boiled they lose it entirely, and taste

History, Use, Propagation, Culture
very much like the potato, for which they might form occasionally an agreeable substitute at table. It is a native of Peru, and is cultivated abundantly in the gardens about Lima, as a salad, for which purpose its succulent stems, and acid flavour, seem strongly to recommend it. It grows freely in the open border, and is readily increased by cuttings, as well as by the tubers, which require to be taken up and treated as potatoes.", (Sw. Fl. Gar., 2. s. 125.)
2619. Balbisia. A showy conservatory plant, which may be increased by cuttings, but is apt to damp off ; if kept in health, it is very handsome.

17323 Stem erect fleshy leafy, Pedun. bifid corymbosely racem. at apex 4 times longer th. Ivs. Lfts. obcord. Petals crenated at apex
[very long
17324 Stem decumb. bran. Leafts. lin. sess. acute, Pedun. much higher than lvs. Bract. approaching cal. Styles 17325 Hairy nearly stemless, Scape 1 -flwd. drooping before expansion, Leaflets 3 obcordate

History, Use, Propagation, Culture,
2631. Púrshia. A dry light soil suits this plant, and cuttings of the young wood will root in sand under a handglass.

17361 Globose subcylindrical, Mammillæ lrge, conical obtuse, Spines 14 - 16 strong straight nearly equal, Petals very unequai
17362 Oblong subcylindrical, Mammillæ Irge. subtetragonal, Spines 7-8 straight slender one longer than rest, Petals

17363 Branches diffuse creeping triangular, Spines 4-5 stiff spreading.

17364 Hybrid between C. speciosissimus and C. Aabellifórmis
[linear obtuse
17365 Stems creeping triangular, Spines numerous bristle-shaped, Flowers solitary from the centre of the bristles, Petals

17366 Branches deeply serrated naked, Tube of flower very long slender, Segms, of cor. lin. lanceol.
17367 Stem serrated repand, Tube of cor. short scaly unarmed
[Petals keeled
17368 Branches seldom with any spines except when young, Cor. large ringent nearly four times longer than tube, 17369 Branches cuneate oblong undulated, Margins appearing curled from large creuatures

6884 Proliferous loose, Joints ovate, Spines setaceous
17370 Joints ovate oblong blunt at both ends, Spines setaceous length of the wool

6904 Lvs, ellipt. Prickles solitary in axils of lvs. fascicled on stems, Flowers panicled, Fruit globose
17371 Lps. ellipt. acute tapering into short footstalks, Spines fascicled, Upper axils bearing thick rounded tleshy 3-5-fiwd, pedunc., Petals obov. retuse soon reflected
17372 Stem with white shining epidermis, Lis. sinuately toothed, Capsule naked 3-valved, Seed broadly marginate Flws. in leafy panic.
17373 Stem branched hispid, Lvs. ovate lanceol. pinnatifid, Bract. pinnatifid, Petals 5 obovate cuspidate

17374 Lvs. ov. acumin. serrately denticul, rounded at the base 3-nerved, Flws. fewer and larger than in \(P\). vulgàris and scentless
17375 Bark whitish, Lvs. broad-ovate acumin, toothed about 5-nrvd. hairy ben. Inflor, racemose, Lobes of cal. acu17376 Livs, ovate-oval with long acuminate tip serrat. toothed 3 -nrvd. hairy ben. Inflor, subracemose, Flws. \(5-7\) showy slightly scented 17377 Lvs. oval-ovate with long acuminate tip toothed pubes. ben. Flws. solitary or \(2-3\) together, Stigmas about 17378 Lvs. ovate acuminated denticulated toment. ben. Racemes termin., Pedicels oppos. Lobes of cal. ovate acute

17379 Peduncles angular short usually solitary, Lvs. ovate lanceol. acum. Caly x hairy 4 -cleft, Petals hairy outside

17380 Subdecumbent, Lvs, grouped wedge-sh. ending in \(2-3\) teeth villose ab. toment. ben. Buds scaiy, Stipules none, or minute

17381 Leaves wedge-shaped oblong pinnatifid plaited, Ovaries 14

and Miscellaneous Particulars.
2632. Cowania. A handsone evergreen hardy shrub, with large showy blossoms resembling a small rose.

7629 The only species
\(\beta\) The only form known in British gardens previously to about 1834 .

Page 456. Class XIII. -- POLYANDRIA. Stamens many, hypogynous, or inserted uuder the Ovary.

\section*{Orcer 1. MONOGYN1A. Stamens many, hypogynows. Style 1.}
2635. Ryanea. Flowers hermaphrodite, apetalous, with petaloid urceolus between the stamens and pistil. Fruit baccate, indehiscent.
2636. Achlys. Sepals 0. Petals 0. Flowers naked, disposed in a dense spike, Stamens numerous. Stigma dilated, hence concave. Ovary ovate, smooth, l-celled, l ovule fixed to bottom of cell.
2637. Hunnemania. Petals 4. Stamens indefinite, Stigma peltate, 4-furrowed, slightly 4-lobed. Capsule siliqueformed, rather compressed, 10 -ribbed, 1-celled, 2-valved.
2638. Ludia. Calyx permanent, 5-7-parted; lobes oval. Petals 0. Stamens numerous, inserted in the disk. Anthers roundish. Ovary 1, ovate. Style filiform. Stigma 3 -fid, rarely 4 -fid. Berry dry, globose, pointed by the style, 6-8-seeded,
2639. Azàra. Calyx 4-5-parted. Petals 0 . Style awl-shaped. Stigma obtuse. Berry many-seeded.
2640. Lee'tia. Calyx 5 -parted, marcescent. Petals 5, or wanting. Stamens indefinite, hypogynous. Anthers roundish. Capsule fleshy, 3 - 5 -valved, small, globose, acuminated with the style.
2641. Godoy̆a. Calyx of many deciduous sepals. Petals 5. Stamens numerous, disposed in many rows, or collected into five bundles. Anthers long, biporose. Style simple. Capsule 3-5-valved, 3-5-celled, with the edges of the valves bent inwards, forming the dissepiments, many-seeded. Seeds winged.
2642. Dendromècon. Sepals 2, caducous. Petals 4. Stamens numerous, filif. Anthers linear. Stigmas 2, sessile, short. Capsule silique-formed, 1-celled, 2 -valved. Placentæ marginal, Hlif. Seeds many, pear-shaped, smooth.

History, Use, Propagation, Culture,
235. Ryanea 17442 sncciosa is a beautiful and singular plant, deserving a place in every stove, Ripened cuttings root freely in sand, under a bell-glass, in heat. The plant thrives in vegetable mould with a little sand.
2636. A chlys 17443 triphilla. This plant succeeds well in common garden soil, and is increased by division of the root.
2637. Hennemània. For culture, \&c., see Fschschóltzia, p. 1218.
2643. Platystemon. Sepals 3, caducous. Petals 6. Stamens numerous. Filaments dilat. Membrane cordate. Anthers linear. Ovaria numerous, linear, each terminated by a linear sessile stigma. Capsules distinct, torulose, articulated, indehiscent, transversely many-celled, hispid. Seeds pendulous, solitary in the cells.
2644. Platystigma. Sepals 3, ovate, deciduous, hairy. Petals 4-5. Stamens numerous. Filaments thread-like. Anthers linear, 2 -celled, opening sideways. Stig. 3, ovate, acute, erect, divergent. Caps. oblong, attenuated at base, 1 -celled, 3 -furrowed, 3 -valved, opening from top to base. Seeds numerous, minute, egg-shaped, black, smooth, shining.
2645. Cálythrix. Calyx drawn out into a cylindrical tube; lobes ending in a long bristle each. Stamens \(\mathbf{1 0 - 3 0}\), free. Fruit dry, indehiscent, l-celled.

\section*{Order 2. DI-TRIGYNIA. Stamens many, hypogynous. Styles 23.}
2646. Pleurándra. Stamens 5-20, all leaning to one side, and fertile. Ovaries 2. Styles filiform. Sepals and petals 5.

Order 3. TETRAGYNIA. Stamens many, hypogynous. Styles four.
2647. Eschschóltzia. Stamens indefinite. Stigmas 4, 2 short and 2 long. Caps. elongated, silique-formed, 2valved, l-celled. Cal. calyptrate. Recept. expanded.

Order 5. POLYGYNIA. Stamens many, hypogynous. Styles many.
2648. Talaúma. Carpels disposed in spikes, 1-2-seeded, joined together into a strobile-like fruit opening valvately and irregularly on the outside. Calyx of 3 sepals.

\section*{MONOGYNIA.}

\(\beta\) Leaves ovate oblong acute, Flws, greenish
\(\gamma\) Leaves much larger than those of the species
17529 Lvs. ovate roundish somewh. cuneated at base, Petals 12 thick oblong obtuse
17530 Lvs. oblong acumin, at both ends, Flws, \(9-12\) petaled outer ones short, Pedun. 1-flwd. rather droopg, clthd. as are petioles of young lvs. with ruf. vill.

17581 Lvs. cuneate-obov. obt, under surf. as well as bran. clthd. with brown pubes. Flws. sess. Outer petals ohov. much larger than cal.
[ab. bluntly cord. 5-1bd. 3-1vd.
17532 Livs. large cord. 5-lbd, woolly ben. Lbs. broad ov. cut and cren. those of involucr, stalked woolly ben. smith 17533 Lvs, bitern, those of involucr. on very short stalks, Ihs. elongat. acumin. Pedic. 2 pubescerst, Sepals 5 elliptical

2648. Talauma is a genus of magnificent trees and shrubs, resembling magnolias. A mixture of loam, peat, and sand suits them. They may be increased by layers or inarching on Magnolia obovata, and ripened cuttings will root in sand, under a hand-glass, in heat.

Page 490. Crass XIV. - DIDYNAMIA. 4 Stamens, of which two are shorter than the others.
Order I. GYMNOSPERMIA. Pericarpium divided into four lobes resembling naked seeds.
2649. Lophánthus. Calyx equal, or oblique, or sublabiate, usually 15 -nerved; superior teeth the largest. Corolla bilabiate. Stamens ascending, or diverging.
2650. Aphanochilus. Corolla tubular. Limb short, bilabiate. Anthers versatile. Cells divaricate. Lobes of gynophore shorter than ovarium.

265l. Dysophýlla. Anthers terminal, also the younger ones confluently l-celled. Stamens somewhat declinate. Corolla almost regular.
2652. Pycnóstachys. Lower segment of corolla elongated, concave. Teeth of fructiferous calyx subulately spinose.

Whorls of flowers spicate.
2653. Sphicele Calyx reticulately veined, 5 -toothed, limb not dilated, teeth nearly equal. Tube of corolla ample. Cells of anthers linear, diverging.
2654. Perilomia. Achenia membranously winged. Segments of corolla flattish. Gynophore elongated, incurved, oblique at apex. Lips of calyx entire.
2655. Roýlea. Calyx tubular at base, 10 -nerved. Segment 5 , equal, oblong, membranous.
2656. Micromèria. Tube of corolla rarely exserted. Calyx nearly equal. Superior stamens antheriferous.
2657. Gardoquia. Calyx tubular, somewhat incurved, with an equal or sub-bilabiate mouth. Tube of corolla much exserted. Stamens \(1-3\), now and then sterile.
2658. Physostegia. Calyx obscurely veined, inflated after inflorescence. Corolla much exserted, with an ample throat.
2659. Coleus. Fructiferous calyx toothed, not spiny, with an open mouth. Filaments monadelphous. Lower segment of corolla elongated, concave.
2660. Chilòdia. Upper lip of calyx entire, tube short, 13 -nerved, lower one bifid. Anthers mutic, 2 -celled.

Order 2. ANGIOSPERMIA. Seeds several, enclosed in an undivided pericarpium.
2661. Pentaritphia. Calyx adnate to the ovarium. Corolla superior. Ring of glands hardly present. Anthers connected by pairs.
2602. Rytitophýllum. Calyx adnate to the ovarium. Corolla superior. Epigynous ring thick and sinuated. Leaves stipulate.
2663. Sinningia. Corolla oblique, ringent, with ouly one gibbosity at base. Calyx adnate to the ovarium, angularly winged.
2664. Amphicome. Calyx tubular, 5-toothed. Corolla tubular, ventricose near base, Limb 5-lobed, ciliated. Stamens 4 , didynamous, with rudiment of a fifth. Stigma bilamellate. Capsule sllique-formed. Seeds winged at both ends, and bearded.

2665. Fieldia. Calyx 5-parted, enclosed in spathe-formed bractea, which is cleft on one side. Corolla tubularly ventricose. Limb equal, 5 -lobed, sub-bilabiate. Stamens 5 ; 4 fertile exserted, sterile one enclosed. Stigma bilamel. late. Berry spongy, longer than calyx.
2666 Técoma. Calyx 5 -toothed. Corolla with short tube and campanulate throat. Limb 5-lobed, sub-bilabiate. Lobes of anthers divaricate. Capsule silique-formed; dissepiment contrary. Seeds disposed in 2 rows, imbricate, winged, transverse.
2667. Salpigłóssis. Calyx 5 -angled, 5 -cleft. Corolla funnel-shaped, 5 -lobed. Lobes 2 -lobed. Stamens didynamous, with rudiment of a fifth between the 2 longer ones. Style tongue-shaped at apex. Stigma truncate, transverse.
2668. Calámpelis. Calyx semi-5-cleft. Corolla with tubular base, ventricose throat, and a contracted 5 -lobed limb. Stamens 4, didynamous, without any rudiment of a fifth. Lobes of anthers obtuse, divaricate, distinct at apex. Wings of seeds repandly sinuated, emarginate at base.
2669. Eccremocárpus. Calyx membranous, 5 -cleft, coloured. Corolla tubular, with an equal throat, and a 5 -lobed equal limb. Stamens 4 , didynamous, with the rudiment of a fifth. Anthers versatile. Cells parallel, combined. Wings of seeds repandly sinuated, nerved.
2670. Stroobilinthes. Calyx 5 -parted. Corolla funnel-shaped. Anthers erect, with parallel cells. Capsule 4 -seeded in the middle. Seeds small.
2671. Goldfússia. Calyx 5-parted. Corolla funnel-shaped. Limb nearly equal. Anthers erect, 2-celled. Stigma subulate, crenulate on one side. Capsule 6 -angled, 2 -valved. Cells 2 -seeded at bottom. Sceds discoid.
2672. Calophanes. Calyx 5-parted, equal. Corolla funnel-shaped. Throat ventricose Limb bilobed, nearly equal. Stamens enclosed. Cells of anthers parallel, spurred at the base. Stigmas simple. Cells of ovarium 2 -seeded. Capsules sessile, almost cylindrical.
2673. Amasònia. Calyx 5-cleft, bracteate. Bracteas coloured. Corolla tubular, 5-cleft, equal. Style bifid. Drupe 2 -4-seeded.
2674. Geissomèria. Calyx 5-parted. Sepals glumaceous, equal. Corolla tubular, clavate. Limb nearly equal, lower segment bearded. Cells of anthers parallel, hairy at apex. Ovarium 2-celled. Cells 2 -seeded. Stigma funnelshaped.
2675. Chloánthes. Calyx 5-cleft. Corolla tubular ; upper lip bifid, lower one tripartite. Stamens exserted. Stigma bifid. Drupe containing 3 nuts.
2676. Lophosnérmum. Corolla bilabiate. Tube wide, gibbous at bas:. Capsule dehiscing irregularly under the apex.
2677. Seymèria. Calyx deeply 5 -cleft. Corolla with a short tube, and a subrotate spreading limb. Stamens a little longer than the corolla. Cells of anthers nearly equal.
2678 . Díplacus. Calyx prismatic, 5 -cleft. Corol'a ringent, 5 -cleft. Lobes emarginate. Stigma bilamellate. Capsule 2-celled. Placenta broad. Seeds subulated at both ends.
2679. Torènia. Calyx plicate, obliquely 5-toothed. Two lower filaments appendiculate, or gibbous at base.
2680. Collinsia. Corolla gibbous above the base. Limb very irregular. Capsule 2-valved. Valves bipartite.
2681. Franciscea. Caly x 5-toothed. Corolla salver-shaped. Stigma 2 -lobed. Capsule 2-celled; dissepiment parallel with the valves, separating from the parietes at the base.

\section*{Page 560. Class XVI. - MONADELPHIA.}

\section*{Order I. TRIANDRIA. Stamens 3.}
2684. Orthrosänthes. Spathe many-flowered, 2-valved. Perianth 6-parted, equal, with a short triangular tube. Stamens 3, combined at the base. Stigmas 3, fringed at top. Capsule oblong, trigonal, many-seeded.
2685. Cypélla. Spathe 2-leaved. Perianth 6-parted, concave at the base; outer segments large, spreading; inner ones small, convolute, reflexed at apex. Stamens 3, monadelphous. Style slender. Stigma 3-lobed, the lobes 3-fid and appendiculate. Capsule oblong, 3-celled, 3-valved, many-seeded. Seeds angular,
2686. Herbértia. Perianth 6-parted, tube very short, 3 outer segments much smaller than the inner ones. Stamens 3, monadelphous. Anthers linear. Stigmas 3, bifid. Capsule oblong, 3-celled, many-seeded. Seeds angular.
2687. Spatalúnthus. Spathe rigid, 2-valved, l-flowered. Perianth spreading, with a very short tube, and a 6 -parted regular limb. Stamens 3, short, monadelphous. Anthers oblong, sagittate. Ovarium warted at apex. Stigmas 3, bifurcate.,
2688. Homèria. Perianth 6-parted, alternate segments smaller, tube very short. Stamens 3, monadelphous. Stigmas 3-fid, the segments bifid and fringed.

\section*{Order 2. PENTANDRIA. Stamens 5.}
2689. Mahérnia Cal. naked, campanulate, 5-cleft. Petals 5, with an obcordate limb, spirally twisted, and straightish claws. Filaments monadelphous at base, dilated into a cordate tubercle, or a cup-formed process in the middle. Styles 5, sometimes joined into 1. Capsule 5-celled, 5-valved, many-seeded.
2690. Maleshérbia. Cal. tubular, membranous, inflated, 5-lobed. Filaments filiform, distinct, or connected with the stipe ot the ovarium. Anthers versatile. Ovarium superior, stipitate, l-celled, with the placentas at the base, from which the ovules arise by the intervention of umbilical cords. Styles 3, filiform. Stigmas clavate. Fruit capsular, 1-celled, 3-valved. Testa crustaceous, brittle, with a fleshy crest and no arillus. Embryo round, in the centre of fleshy albumen, with the radicle next the hilum.
2691. Clintonia. Limb of cal. 5-cleft. Cor. bilabiate, with hardly any tube. Anthers cohering: 2 superior ones bearded. Capsule silique-formed, triangular, dehiscing by 3 loriform valves, many-seeded. Seeds attached to two parietal placentas.

\section*{Order 6. DODECANDRIA. Stamens 12.}
2692. Philothèca. Cal. 5-parted. Petals 5, unguiculate. Stamens 10, unequal, connate at base, with tube smooth and free, part of the filaments hairy. Fruit of 51 seeded carpels. Leaves alternate, linear.

\section*{TRIANDRIA.}

\title{
17680 Pubescent, Ivs, wedge-sh. obtusely dent. Pods corymbose acutely \(2-1 \mathrm{bd}\). ma gins gnawed crenat. Seeds winged, Stem strictly branched
}

17681 Lvs, Lanceol. toothed, Petals obov. Stigmas globose, Fruit silique 4-sided
17682 Velvety-pubescent somewhat clammy, Lfits. 7 with 20 veins on eacn side of each leaflet
17688 Unarmed, LHts. 5-7 lanceol. acuminated pilose, Brac. ovate, Petals length of pedicels, Pedicel of fruit long
2693. Omphaldbium. Cal. 5-parted. Petals E, imbricate in æstivation. Stamens monadelphous, or somewhat polyadelphous at base. Carpels 5 , each bearing a style. Capsules 1-5, legume-formed, 2 -valved, dehiscent. Seeds twin, or solitary, exalbuminous. Leaves trifoliate, or impari-pinnate.
2694. Púrlia. Flowers hermaphrodite. Calyx tubular, bilabiate, imbricate in æstivation. Legume compressed, many-seeded. Seeds covered with farinaceous substance.
2695. Sarcocaúlon. Sepals 5, equal. Petals 4, equal. Stamens 15, monadelphous at base.
2696. Montezuma. Calyx hemispherical, truncate, sinnately toothed. Stamens numerous, twisted around the style, monadelphous, with 5 distinct furrows. Capsules globose, 4-5-celled. Cells many-seeded. Leaves entire.
2697. Assonia. Calyx girded by a 3 -crenate l-leaved involucel. Antheriferous filaments 15; 3 fertile between each sterile one. Styles 5 , very short. Carpels 5,2 - seeded, closely connected into a single capsule. Seeds rather triquetrous, not winged.
2698. Plagianthus. Calyx 5-cleft. Petals 5,2 of which are approximate, remote from the rest. Stigma clavate.
2699. Nuitállia, Cal, naked, 5-cleft. Anth. numerous. Stig. numerous, filiform. Carp. numerous, disposed into a ring, or whorl ; 1 -seeded, not opening spontaneously.
2700. Lebretonia. Cal. 5-parted, girded by a shorter 5 -parted Involucel. Petals 5, exserted in part, t wisted in æstivation, with a spreading limb. Styles 10 . Carp. 5 , or only 4 from abortion, 1 -seeded, indehiscent.
2701. Abutilon. Cal, naked, 5 -cleft, usually angular. Styles multifid at apex. Carp. capsular, 5 - 30 , many-seeded, usually bladdery, disposed into a whorl around the axis, so closely connected with each other as to form a many-celled capsule.
2702. Eriola'na, Cal. tomentose, girded by a 5-leaved involucel. Leafiets jagged, 3 inner ones largest, all shorter than the calyx. Petals unguiculate. Stam. disposed in many series, monadelphous, outer ones shortest, all fertile. Style solitary, villous, crowned by numerous aggregate small stigmas.
2703. Recvèsia. Flowers hermaphrodite. Stams. monadelphous. Anth. 15, sessile on the top of the tube. Caps. stipitate, 5 -celled, 5 -valved. Cells 2 -speded. Seeds winged at base.
2704. Stravàdium. Limb of calyx 4-parted. Ovarium semilocular. Cells 2-ovulate. Otherwise agreeing with Barringtònia, in p. 561.
2705. Morisònia. Cal obovate, bifid. Petals 4. Stams. 20, somewhat monadelphous at base? Berry stipitate, globose.

and Miscellaneous P'articuturs.
2698. Plagiunthus. A shrub which, if planted in a warm sheltered situation, will stand our winters; and cuttings of young wood root freely in sand under a hand-glass.
2699. Nuttállia is a genus of very elegant plants when in blossom, well deserving a place in every collection. Peat with a little sand suits them best. They may be increased by division or by seed.
1477. Urèna 17726 specidsa. "c This is a very elegant plant, with large pink flowers, which are disposed in a kind of terminal racemose panicle. It differs so much in habit from all the other species of this genus, that we doubt its being a genuine species of Urèna." (Don's Mill., 1. 47.)
2700. Lebretonia. The species of this genus deserve to be cultivated in every collection, on account of their showy scarlet blossoms. A mixture of loam and peat suits them best. Cuttings taken off close to the stem of the plant root readily in sand under a hand-glass. None of the leaves should be taken off, or shortened above the sand.
2701 . Abutilon. Some of the species of this genus are rather ornamental when in flower. They thrive in any light rich soil, and are readily increased by cuttings, which should be placed in a gentle heat.

History, Us \({ }^{n}\), Propagation, Culture,
2706. Monnina. A genus of plants not worth cultivation for ornament. A mixture of loam and peat suits them ; and cuttings of the young wood root readily in sand, under a hand-glass, in heat.
2707. Amhérstia 17746 nóbilis is a native of the Burman empire, in the garden of a decayed kioun, a sort of monastery, 2 miles from the right bank of the Salven river, and 27 miles from the town of Martaban, but its native place of growth is still unknown, as the trees found in the garden have undoubtedly been planted there. The flowers are large, of a fine vermilion colour, diversified with yellow spots. This tree, when in foliage and blossom, is the most superb object that can possibly be imagined, and not surpassed by any plant in the world. The Burmese name of the tree is Thoka.

17745 Lvs. oblong obtuse cuneate at base obsoletely veined rather leathery glabrous as are branchlets, Rac. solitary

\section*{DECANDRIA.}

\section*{17746 The only species}

and Miscellaneous Particulars.
Handfuls of flowers were presented as offerings in the cave before the images of Buddha. Along with this tree were found some trees of Mesua férrea and Jonesia Asoca. It is not a little remarkable, that the priests of these parts should have manifested so good a taste as to select three sorts of trees, as ornaments to their objects of worship, which can hardly be surpassed in beauty. A light loamy soil suits this tree; and large cuttings root in sand, under a hand. glass, in heat.
2709. Lálage 17751 ornata is a very gay flowering shrub, which requires to be kept in a well-aired green-house, in peat soil, and may be multiplied by cuttings.

Page 660. Class XIX. - SYNGENESIA. Stamens 5. Anthers united by their edges.

\section*{Order 1. 丕QUALIS. Florets of the disk and ray all hermaphrodite.}
2722. Craspèdia. Heads 5 -flwd. homogamous, girded by bracteas seated on a cylindrical woolly rachis, receptacle narrow. Paleæ entire. Scales of involucrum membranous. Corollas tubular, 5 -toothed. Anthers setiferous at the base. Achænia oblong, villous. Pappus in one series, composed of filiform plumose bristles.
2723. Erythrole' na. Involuc. conical ; inner lvs. imbricated, outer ones reflexed, spiny-toothed. Receptacle convex, pilose. Flowers hermaphrodite, tubular, with a 5 -parted limb and a 5 -angled tube. Filaments glandular. Anthers bisetose at the base. Stigma bifid. Pappus sessile, plumose.
2724. Alðmia. Heads many-flwd. Involucrum campanulate, imbricate. Scales narrow, acute. Receptacle naked, convex. Tube of corolla slender, glabrous. Anthers terminated by obtuse appendages. Lobes of style elongated. Achænia 5 -angled, naked at top.
2725. Ozothd́mnus. Head 3-20-flowered, homogamous. Receptacle alveolate, usually naked. Involucrum imbricate. sicale scarious, obtuse. Corolla 3-toothed. Anthers bisetose at the base. Achænia obovate. Pappus in one series, composed of filiform scabrous bristles.

Order 2. SUPERFLUA. Florets of the disk hermaphrodite, of the ray female.
2726. Leptostélma. Involuc. equal, hemispherical. Receptacle paleaceous. Flowers of the rag ligulate, female ; those of the disk hermaphrodite, tubular, 5 -toothed. Pappus capillary.
2727. Adenotrichia. Involucrum double, many-lvd.; outer lvs. вquarrose, subulate, glandular. Flowers of the ray ligulate, almost entire, female; those of the disk tubular, filiform, hermaphrodite. Receptacle naked. Pappus pilose. 2728. Diplopáppus. Ray flowers in 1 series, female ; those of the disk hemaphrodite, tubular. Pappus in 2 series. Corollas of the disk regular. Achænia beakless.
2729. Brachyglottis. Heads 9-10-fowered, heterogamous. Ray flowers in 1 series, female, ligulate, shorter than the disk ; disk flowers tubular, 5 -toothed, hermaphrodite. Receptacle naked. Involucrum oblong, surrounded by 1 row of linear scales. Achænia oblong. Pappus in 1 series, composed of dense scabrous bristles, which are combined at the base.
2730. Rhoddnthe. Heads many-flwd. Flowers hermaphrodite. Pappus in 1 series, hair-formed, plumose. Achænia beakless, woolly. Receptacle naked.
2731. Diplocoma. Involucrum many-lvd. imbricated. Flowers of the ray female, ligulate; those of the disk hermaphrodite, tubular. Achænia of the rays bald at the top; those of the disk pappose. Pappus double, unequal.
2732. Nèja. Involucrum many-lvd. imbricated. Receptacle pitted. Flowers of the ray female, ligulate; those of the disk hermaphrodite, tubular, 5-toothed. Achænia unitorm. Pappus double; outer paleaceous, inner pilose.
2733. Mutisia. Involucrum many-lvd. imbricated. Receptacle naked. Flowers of the ray ligulate, female; those of the disk hermaphrodite, bilabiate. Filaments papillose. Anthers bisetose at the base. Achænia a little beaked. Pappus in many series, plumose.
2734. Chætachle'na. Heads many-flwd, heterogamous, ray-formed. Involucrum hemispherical, imbricate, with linear flat scales. Receptacle pilose or fringed. Ray flowers bilabiate; outer lip large, 3 -toothed ; inner one small, bipartite. Corollas of the disk tubular, 5 -cleft, glabrous. Anthers bisetose at the base. Achænia beakless, somewhat compressed. Pappus in two series, setaceous, scabrous.
2735. Lasthenia. Head many-flowered, homogamous. Flowers of the ray female, tubular, obliquely truncate. Receptacle conical, papillose. Scales of involuc. in one series, combined into a toothed ciliated cup. Corolla short, with an inflated throat and a 5 -toothed limb. Achænia compressed, pubescent. Pappus composed of 5 -10-toothed paleæ.

17829 Lvs, altern. bipinnatifid, Lobes bluntish, Pedic. extra-axill. Lbs. of cal. lanceol.-linear acute shorter than petals 17830 Clthd. with harsh barbed white hairs and a few [hispid inciso-serrate, Pedun. spread. ab. half length of lvs. 331 Cew stinging ones intersp. Lvs. scatter. petiol. spread. ov. acute 17831 Canescent, Lvs. oppos, palmate toothed, Cal, segms. long and linear, Outer appendages hatchet-formed awned 17832 Climbing, Lvs. cord. palmate lobed, Petals sessile keeled, Append. 3-lbd. truncate each furnished inside with 2 bristles, Caps. spiral ribbed

17833 Lower lvs, generally 7 - but sometimes 5 -lobed ; upper ones deeply bipinnatifid
17834 Leaves palmate with bipinnatifid lobes, Flowers bibracteated, Petals hispid
17835 Stem dichotomous, Segments of leaves obtuse ciliated

and Miscellaneous Particulars.
2721. Scyphánthus is a twining annual, with somewhat curious inforescence. It is said to have been lost soon after its introduction in 182?
2736. Baeria. Head many-flowered, heterogamous, radiate. Scales of involuc. about 10 , flat, in 2 rows. Receptacle conical, naked. Flowers of the disk hermaphrodite, 5 -toothed; those of the ray female, ligulate, fertile, in 1 series. Achænia fusiform, somewhat tetragonal, glabrous.
2737. Eriophiflum. Head many-fowered, radiate. Flowers of the ray female, ligulate. Flowers of the disk hermaphrodite, 5 -toothed, glandular. Involuc, ovate, with \(1-2\) series of adpressed scales. Receptacle uaked, or a little fringed. Achænia turbinate or linear, tetragonal, glabrous. Paleæ of pappus 4-8, oval or oblong, membranous.
2738. Lagenophora. Head many-flowered, heterogamous. Flowers of the ray ligulate, female, in 1 series; those of disk tubular, 5-toothed, hermaphrodite, male. Receptacle flat, naked. Scales of involuc. in 2 series, acute, adpressed. Achænia of the rays compressed, oblong, beakless; those of the disk abortive.
2739. Oxyitra. Head many-flowered, radiate. Flowers of the ray 10-12, in 1 series, ligulate, female; those of the disk tubular, 5 -toothed, hermaphrodite. Scales of involuc. in 1 series, convolute, each drawn out into lin. leafy appendage at top. Receptacle paleaceous. Branches of the styles of the disk flowers drawn out each into a hispid appendage. Achænia compressed, glabrous.
2740. Cladánthus. Heads many-flowered, heterogamous. Flowers of the ray ligulate, neuter ; those of the disk tubular, hermaphrodite, 5 -toothed. Receptacle conical, paleaceous, intermixed with threads. Scales of involucrum in 1 series, scarious at top. Achænia compressed, glabrous.
2741. Eriócoma. Involucrum few-lvd. Receptacle paleaceous. Palez cucul mucronate. Flowers of the ray 4-10-ligulate, neuter; those of the disk hermaphrodite, 5 -toothed. Achænia cuneated, glabrous at top, enclosed by the persistent paleæ.
2742. Viguierra. Heads many-flowered, heterogamous. Flowers of the ray neuter, ligulate; those of the disk hermaphrodite, 5 -toothed. Involucrum semiglobose, scales nearly equal, each drawn out into leafy appendage at top. Receptacle paleaceous. Achænia compressed, obovate, pubescent, crowned by four lamellæ and two awns from the angles.
2743. Calliopsis. Heads many-flowered, heterogamous. Flowers of the ray neuter, in 1 series, ligulate, 3-5-toothed ; those of the disk hermaphrodite, tubular, 5-toothed. Involucrum in 2-series, outer scales short, squarrose, inner ones large, erect, combined. Receptacle flat, paleaceous. Achænia compressed, glabrous, incurved, truncate, with a minute epigynous disk.
2744. Plectocéphalus. Involucrum globose, imbricate. Appendages to scales cartilaginous, pectinated. Receptacle clothed with setaceous paleæ. Flowers of the ray neuter, funnel-shaped, radiate; those of the disk hermaphrodite, tubular, quinquefid. Fappus uniform, pilose, scabrous, caducous.

\section*{Order 4. NECESSARIA. Florets of the ray female, of the disk male.}
2745. Moscaria. Involucrum 5-lvd. Receptacle paleaceous. Paleæ of two forms ; outer paleæ cucul. gibbous at the base, and truncated at apex. Flowers all hermaphrodite, bilabiate, equal. Pappus paleaceous, very short.
2746. Centroclinium. Involucrum subglobose or cylindrical, imbricated. Flowers of the disk tubular, 5 -toothed, deeply-cleft on one side; those of the ray 7-12 in number; bilabiate, inner lip very minute, bipartite; outer lip very long, 3 -fid. Anthers biaristate, stigma entire. Pappus unequal, scabrous. Receptacle hispid.

History, Use, Propagation, Culture,
2722. Craspadia is a genus of ornamental herbaceous plants, increased by division of the root and by geed, and
thrives in good light loam.
2723. Erythrole'na 17637 conspicua is an ornamental blennial, and đelights in a warm sheltered situation, planted in rich garden soil.
2724. Aldmio. A mixture of sand and loam suits this genus, and cuttings root readily in sand under a bell-glass.

17836 Lvs. oblong altern. gradually smaller upwards lower and root Ivs. Iongest and broader upw. so as to be spathul. clthd. with appress. rather silky hairs

History, Use, Propagation, Cuiture,
2730. Rhodánthe is a very elegant little tender annual, and highly deserving a place in every greenhouse, and it requires to be grown in a good light soil.
1747. Podolepis 17860 gracilis is a very pretty annual, deserving a place in every flower border.
2731. Diplócoma. A handsome but rather tender herbaceous plant, requiring a light soil, with slight protection in severe weather.
2732. Nèja may be readily increased by cuttings, and will thrive in a good light soil.
2733. Mutisia is an exceedingly interesting genus of shrubby climbers, with leaves terminating in tendrils, by the prehension of which the stems are supported. M. latifolia represents a family of climbers so very different from every other hitherto propagated in British gardens, that we cannot but strongly recommend it for trial against every conGervative wall. (Arb. Brit.)
2734. Chatachle'na. A very pretty herbaceous plant, of easy culture.

17889 Stem glabr. Lvs. altern. ov. acumin. quite entire 3 -nerved scabrous above and pilose beneath, Petioles ciliated, Receptacle conical hollow
[obl. minutely tubercled on both sides \(\dagger 12488\) Glabr. Radical lvs. pinnate or bipinnatifid, Outer scales of involucrum very short acute, Ligulæ trifid, Achænia

17890 Radical lvs, bipinnatifid cauline ones pinnate, Outer scales of invol. lin. obl. Ligulæ 3-toothed, Achænia smooth 17891 Pilose, Upper lvs. ternate, Segms. ovate, Achænia ventricose tuberculated
[margined with a short wing

17892 Lvs. obl. membran, undiv. Pedunc. ventric. at top, Outer scales of involuc. 3 times as short as their appendages

\section*{NECESSARIA.}

17893 The only species

17894 Lvs. lanceol. waved nrly, ent. white and cottony ben. Pedunc. naked, Invol. cylindr. imbricat. with many closepressed subulate scales

\section*{SEGREGATA.}

17895 Lvs. oval lanceol. cuneate at the base and acumin. at apex coarsely serrated in the middle

and Miscellancous Particulars.
2744. Plectocephalus. A very curious and striking annual.
2745. Gastrocärpha. A handsome strong-growing annual.
2746. Centroclinium. A showy plant, requiring rather a moist high temperature.

}

Orchida'cese. - "The uses to which the plants of this family are applied" are few, but in several instances highly romantic. In Demerara, that most deadly of all poisons, the 'Wourali,' is thickened by the juice of the Catasetums; and in Amboyna the true 'Elixir of Love' is prepared from the minute farina-like seeds of Grammatophyllum speciosum. In Mexico, where the 'language of flowers' is understood by all, the Orchidaceæ seem to compose nearly the entire alphabet. Not an infant is baptised, not a marriage is celebrated, not a funeral obsequy is perfermed, at which the aid of these flowers is not called in by the sentimental natives, to assist the expression of their feelings; they are offered by the devotee at the shrine of his favourite saint, by the lover at the feet of his mistress, and by the sorrowing survivor at the grave of his friend: whether, in short, on fast days or feast days, on occasion of rejoicing or in moments of distress, these flowers are sought for with an avidity which would seem to say that there was 'no sympathy like theirs ;'-thus, 'Flor de los Santos,' 'Flor de Corpus,' 'Flor de los Muertos,' 'Flor de Maio,' 'No me olivides' (or 'Forget me not'), are but a few names out of the many that might be cited, to prove the high consideration in which our favourites are held in the New World. Nor are these the only honours that are paid to them: for Hernandez assures us that in Mexico the Indian chiefs set the very highest value on their blossoms, for the sake of their great beauty, strange figure, and delightful perfume; while in the East Indies, if Rumphius is to be credited, the flowers themselves positively refuse to be worn, except by princesses or ladies of high degree. In Honduras, again, the large hollow cylindrical stalks of a fine species of Epidendrum [E. tibicinum] are made into trumpets by the little boys and girls of the country; and the pseudo-bulbs of several of the more succulent species are used instead of resin for the strings of their guitars. The following are, however, almost the only known instances in which the tribe do any direct service to mankind. The bulbs of Maxillaria bicolor contain a large quantity of an insipid watery fluid, which is greedily sucked by the poor natives of Peru in the dry season; a fluid of a similar nature is obtained from what is probably a Lælia, in Mexico, and is administered as a cooling draught in fevers; from the roots of some of the orchises, the nutritive substance called 'Salep' is obtained; in New Zealand certain species are of considerable importance as esculents; and in Guiana, the soles of the shoemaker are as much indebted to the viscid matter obtained from the Catasetums and Cyrtopodiums, as are the poisoned arrows of the Indians." (Bate. Orch., p. 2.)

Mr. Bateman, speaking of the fragrance of many of this order, says: "We question whether 'Araby the blest' can boast of any perfumes that can at all compete in sweetness with those exhaled by such plants as Angræcum odoratissimum Lindl. MSS., Tetrapeltis tragrans, Aerides odoratum, and Epidendrum aromaticum. Other species emit odours which remind the recipient of the smell of a druggist's shop, of the milk of the cocoa-nut, of fresh hay, of wallflowers, violets, pomatum, aniseed, and angelica, of noyau, cinnamon, allspice, citron, musk, and honey. Some of these yield no fragrance, except in the daytime; but there are others which, like Epidendrum nocturnum and Brassavola nodosa, are aromatic only by night; and there are none, we believe, which are positively offensive at any hour, either of the night or day." (Ib., p. 4.)

The attention and curiosity are excited no more by the beauty and delicacy of the blossoms of many of this tribe, than by the very close resemblances they bear to objects of the animal kingdom. In our native species we find the bee, fly, spider, lizard, man, \&c., surprisingly imitated; and in those of warmer climates, swans, eagles, doves, pelicans, \&c. sec.

The cultivation of Orchidàceæ may be mentioned under two heads, namely, that of terrestrial and that of epiphytal Orchidàceæ.
Terrestrial Orchidàceæ should never have a great volume of external air admitted at once, however fine the weather may be. To prevent the house (which should have a southern aspect) from becoming too hot, a thick canvass shading should be drawn over it during summer sunshine. During the growing season, Orchidaceæ require a moderately moist heat, varying from \(65^{\circ}\) to \(85^{\circ}\); in the dormant season, from \(60^{\circ}\) to \(75^{\circ}\) is quite sufficient; in the season of rest the house should be kept dry. Orchidaceæ in pots should be sparingly watered in the growing season ; in the dormant state, little or no water should be given. The secret of growing these plants is to take care never to kill the old roots: when too much water is given, while the plants are in a growing state, almost all the old roots invariably perish. (Paxton in part.)

Epiphytal Orchidàceæ may be grown in the same house with, and receive nearly the same treatment as, terrestrial Orchidaceæ, except that they require to be grown on, instead of in, the soil, attached to blocks of wood, or in baskets, or any rustic construction in the basket way, and suspended from the roof, or by any other suitable means, In the outset, before the plants are established on the soil, or wood, where they are intended to be grown, it is very necessary to secure firmly the plant, and such roots as may be already formed, to the wood or soil, by means of bast or pegs, as judgment shall direct. The best kind of soil for growing epiphytal Orchidaceæ on is found to be good surface peat, cut into pieces of 1 in . to 2 in . square; this should be placed over a considerable quantity of drainage, in order to carry off superfluous water, and at the same time, if they are plunged in a tan bed, will allow the heat to rise more freely than if the pots were entirely filled with soil.
\({ }^{4}\) It is of the greatest importance to preserve and encourage the roots; and, as they are generally protruded near the surface of the soil, it should be raised several inches above the level of the pot, in a pyramidal form, in order that they may have full room to push out." (Bot. Reg.)

Syringing the plants moderately, when in a growing state, till the flowers are noxily expanded, helps their growth much.

For some other particulars respecting this order, see p. 748. to 767.

\section*{Order 1. MONANDRIA. Stamen 1.}
1. Malaxi'de\&. - Pollen cohering in masses of a fine waxy texture, without any of the cellular substance by which the grains are connected, remaining under the form of a distinct gland lying upon the stigma, or of a transparent caudicula between the pollen masses and the gland.

> 1. Pleurothälleq. Column erect, drawn out a little at the base.
+1894 Pleurothállis, page 749.
11913. Octomèria, page 749.

2747 Lepanthes. Sepals spreading, connate at the base. Petals 2, free and short. Labellum 2-lobed at apex, and combined with the column. Column elongated, cylindrical, 2 -winged. Pollen masses 2.
2748. Specklinia. Sepals conniving, equal, distinct; lateral ones saccate at the base, gibbous outside. Petals conforming to the sepals, but much smaller. Labellum free, saccate at base. Column short, free, membranaceously winged. Anther l-celled, Pollen masses 2. (No species given.)
+1924 Stèlis, page 750.
2749. Obronia, Sepals spreading or reflexed, usually equal, free. Petals smaller than the sepals. Labellum ascending, of various forms, usually elongated, always more or less 4-iobed. Colump small, free. Stigma elevated. Anther 2-celled. Pollen masses 2, pear-shaped, solid. (No species given.)
+1927. Micróstylis, page 750.
+1925. Malixis, page 750.
+1882. Corallorhixa, page 749.
2750. Apléclrum. Petals equal, connivent. Labellum unguiculate, not drawn out at the base. Column free. Anther seated below the summit of the column. Pollen masses 4, oblique, lenticular.
2751. Aciänthus. Sepals subringent, acumin., free. Petals smaller, acura. Labellum free, entire, bicallous at base, with a naked disk. Column semiterete, clavate. Anther term., recumbent, 2-celled. Stigma ovate, transverse. Pollen masses 8.
+1928 Lhparis, page 751.
2752. Caxia. Sepals distinct, equal, spreading. Petals nearly equal, but a little smaller than sepals. Labellum
quite entire, unguiculate, continuous with the base of the column. Column short, continuous with ovarium, drawn out a little at base. Anther 2-celled. Pollen masses 4, by pairs.
1904. Pholiddia, page 749.
1897. Cœlogyne, page 749.

\section*{§ 2. Denilrobièß. Column recumbent, drawn out much at the base.}

2753 Megaclinium. Sepals erect, unequal; lateral ones the smallest, combined with the column. Petals short. Labellum short, quite entire, articulate with the base of the column. Column short, marginate, disk-formed. Anther obsoletely 2 -celled. Pollen masses 4, cohering by pairs.
2754. Bolbophyllum. Sepals erect, acumin., nearly equal; lateral ones combined, or connate with the base of the column, and oblique at the base. Petals short. Labellum articulated with the foot of the column, unguiculate, usually entire. Column short, bidentate or 2 -horned in front. Anther 2 -celled. Pollen masses 4, free, very unequal, sometimes combined in one, and sometimes cohering by pairs.
2755. Cirrhopétalum. Sepals ringent ; lateral ones acumin., drawn out at the base, adnate to the column, much longer than upper one. Petals short, apiculated. Labellum entire, articulated with base of column. Column small, drawn out at base, and furnished with 2 petaloid horns at top. Anther 2-celled. Pollen masses 4, 2 inner ones smaller.
2756. Trias. Sepals equal, ovate, spreading, connate at the base. Petals small, erect. Labellum small, undivided. Column short, semiterete, emarginate, free. Anther 2-celled, drawn out into a petaloid, cuneated, emarginated membrane at the apex. Pollen masses 4, 2 inner ones smaller.
2757. Bryobium. Flowers villous. Sepals conniving, lateral ones equal at the base. Petals narrower and shorter than the sepals, reflexed between them. Labellum undivided, unappendiculated, constricted at the base. Column short. Pollen as in E'ria.
+1912. E'ria, page 749.
2758. A'porum. Sepals fleshy, erect; lateral ones larger, oblique, connate with the column. Petals smaller than upper sepal. Labellum articulated with foot of the column, undivided, or 3-lobed. Limb crested, callous, or naked. Column semiterete, drawn out at base. Anther sess., 2 -celled, sometimes membran, at apex. Pollen masses 4, collateral by pairs.
\(\dagger 1908\). Polystcichya, page 749.
+1900. Dendròbium, page 749.
2759. Paxtonia. Sepals 6, spreading, equal. Labellum conforming to the petals. Column erect, terete, subclavate, a little shorter than the petals. Anther termin., opercular, deciduous. Pollen masses 8 , narrow, clavate, cohering at tops.
II. Epide'ndrefs, - Pollen cohering in masses of a fine waxy texture, with cellular substance. Caudiculæ not transparent, and connected with the stigma by means of a gland, as in V únda; but powdery, and very often turned back on the face of the pollen masses. Anther terminal, opercular.
+1907 Epidendrum, page 749.
2760. Dinèma. Sepals and petals nearly equal, spreading. Labellum large, membranous, undivided, unguiculate, combined with the base of the column. Column short, bicornute. Anther 2-celled. Pollen masses 4, adnate by pairs to 2 replicate caudiculæ.
2761. Encÿclia. Sepals and petals nearly equal, connivent. Labellum cuculate, involving the columns, 3-lobed at apex, callous at base. Column free, semiterete, clavate, parallel with the labellum. Anther 4 -celled, with marginate dissepiments. Pollen masses 4. Collateral caudiculæ 4, revolute.

2762 Chysis. Sepals a little connate, spreading. Petals conforming to the sepals. Labellum 3-lobed, spreading ; Column marginate, channeled, rustic. Anthers roundish, glabrous. Pollen masses 8 ; the four outer ones thin, and the four inner ones thicker, beak convex.
2763. Physinga. Sepals membranous, equal, connate at the base. Petals small, obliquely adnate to the base of the sepals. Labellum fleshy, tubercular, undivided, connate with the base of the column, and furnished with a bladderformed sac at the base. Column fleshy, short, 2-lobed, antheriferous at the base. Pollen masses 4, adnate to 2 twin powdery threads.
+1903 . Isochìlus, page 749 .
2764. Hartuégia. Perianth spreading, coloured. Lateral sepals drawn out at the base, adnate to the labellum. Labellum connate with the column, gibbous at base, ovate. Anther 4 -celled. Pollen masses 4, Caudiculæ replicate.
+1914. Brassavdla, page 749.
2765. Lae lia. Sepals flat, lanceol., equal. Petals larger than sepals, fleshy, flat. Labellum 3-parted, lamellate, twisted round the column. Column wingless, fleshy, channeled in front. Pollen masses 8, with 4 elastic caudiculæ.
2766. Schombúrghia. Sepals and petals similar, spreading, all free and equal at the base. Labelluindifformed, membranous, 2-3-lobed, cucullate, connate at the base, with the margin of the column tumid above the base with lamellate veins. Column margiuate. Pollen masses 8.
+1506. Cattleya, page 749.
1905. Broughtonia, page 749.
2767. Lcptotes. Sepals and petals linear, nearly equal, spreading. Labellum 3-lobed, parallel with the column. Lateral segms. short, convolute around the column, middle segm. obl. with reflexed margins. Column short, thick, semiterete. Pollen masses 6, incumbent; 2 upper ones pear-shaped, oblique, compressed; 4 lower ones unequal and thinner.
1911. Blètia, page 749.
2768. Crybe. Sepals and petals similar, lanceol. conniving, lateral ones oblique at the base. Labellum large, membran., cucullate, never expanded, half-connate with the ciavate marginate column.
2769. Pesomeria. Sepals nearly equal, free, deciduous. Petals conform, adnate to the base of the column, persistent. Labellum connate with the base of the column, gibbous at the base, with an undivided convolute limb. Column clavate, semiterete. Pollen masses 4, cuneate.

2770 . Phàius. Sepals and petals nearly equal, spreading, free. Labellum usually cucul., adnate with the base of the column, spurred, entire, or 3-lobed, usually keeled, lamellose or crested above. Column erect, continuous with the ovarium, semiterete, marginate, elongated. Anther 8 -celled. Pollen masses 8 , nearly equal,

1II. VA'NDBA. - Pollen cohering in masses of a fine waxy texture. Caudiculæ separating along with the gland of the stigma, and forming a strict adhesion with the pollen masses. Anther terminal, rarely dorsal, opercular. 2771. Nanòdes. Perianth ringent. Upper sepal arched, 7ateral ones connate to the labellum at the base. Petals conforming to the lateral sepals, free. Labellum fleshy, undivided, connate with the column. Column winged. Anther 2-celled, beaked. Pollen masses 4 , collateral, sessile.
2772. Aspdsia. Perianth spreading, equal; lateral sepals free, the upper one connate with the petals at the base. Labellum oblong, concave, spurless, obsoletely 4 -lobed, half-connate with column. Column parallel with the labellum, semiterete, marginate. Pollen masses 2, pear-shaped, furrowed behind. Caudiculæ flat, cuneated.
11902. Ornithidium, page 749.
2773. Sophronitis. Perianth spreading. Sepals nearly equal, imbricated, free. Labellum entire, cucul., connate with the base of the column, with a simple transverse crest in the middle. Column free, winged ou both sides at the apex. Anther 8 -celled. Pollen masses 8.
+1890. Trizeux is, page 749.
1910. Ornithocéphalus, page 749.
